The growth and development of the N. A. R. D. has been largely responsible or has made possible many of the co-operative organizations of retail druggists. It has been the policy of the committee to treat fairly with these organizations and take a neutral stand in the controversies that occasionally arise. While many of these organizations are materially helpful to the retail drug trade, your committee believes it should be the unalterable policy of the N. A. R. D. to avoid entanglements with such organizations because of the broad scope of our work and the fact of our laboring for the retail drug trade as a whole. Nevertheless, we believe it to be the duty of the N. A. R. D. to carefully scrutinize co-operative enterprises in order to protect its membership from loss by unscrupulous promoters.

CO-OPERATION WITH THE AMERICAN PHARMACEUTICAL ASSOCIATION AND STATE PHARMACEUTICAL ASSOCIATIONS.

There are many branches of our work that suggest added benefits through more thorough co-operation with the American Pharmaceutical Association and State pharmaceutical associations, constituted mainly of retail druggists. There is every reason why these organizations should work in perfect harmony with the N. A. R. D. and get into closer relations on such matters as legislation and propaganda work. It is only by concentrated and united effort that our ideals can be reached.

SELECTION OF MEETING PLACE.

It is unfortunate that in selecting a meeting place for the convention there is always danger of disappointing many of our affiliated organizations who naturally believe preference should be given their localities. The committee in making selection of meeting place aims to take the broadest possible view of serving the best interests of the members.

The selection of Niagara Falls for this convention the committee believes to be a happy one, because of the beauty of surroundings, the full co-operation of the retail druggists, the business men's association and the hotels.

FINANCES.

The real success of this association, like any other business proposition, must depend largely on its financial standing. The amount of work done, the quality of help engaged in the work, new departures and general increased usefulness depend greatly on the financial support of the members, supplemented by the earning power of N. A. R. D. Notes.

In announcing a healthy condition of finances the committee believes that the association has been singularly successful since its beginning in the husbanding and handling of its finances. All bills and accounts are promptly paid and discounts taken advantage of when available.

MEETING OF THE EXECUTIVE COMMITTEE.

The established regular custom of holding three meetings of the committee during the convention year has again been carried out. One immediately after the Pittsburgh convention, the midyear meeting at Chicago, the week of February 27th, and the final meeting just preceding the opening of this convention.

Experience has demonstrated that the launching of activities for the year depends largely on the outcome of the so-called mid-year meeting of the committee. The practice has been to call this meeting as early in the calendar year as possible. January being the general meeting time for so many of the corporations and organizations that members of the committee are interested in, it seems almost impossible to arrange a satisfactory date during this month, and the committee therefore suggests that future mid-year meetings be held before the first of the calendar year. The general outline of the work of the year can thus be made in time for beginning of activities with the fiscal year.

GENERAL RESULTS OF THE YEAR'S WORK AND OUTLOOK OF THE FUTURE.

Viewed from all angles the past year has been one of pronounced success in more firmly establishing the stability of the organization. The many expressions by resolutions of both State and local associations, of loyalty and confidence are reassuring evidence that the retail drug trade more fully appreciates the necessity of a great national organization safeguarding its welfare.

The flattering comments of the medical profession, both by correspondence with headquarters and in speech at the successful get-together meetings held in various parts of the country, exemplify the success of this feature of our work and the continued need of featuring it.

The war against overpriced proprietaries is making headway in not only the occasional reduction in price of some product of long standing, but in keeping the manufacturer within bounds in the pricing of new remedies and products.

The retail drug trade has the power of realizing an adequate profit on proprietaries if it will but unanimously demand it. The war against overpriced proprietaries should be carried on relentlessly by every individual as well as the association.

Price protection is constantly engaging the attention of the manufacturer and is making sure progress where the effort is honestly made. The slogan should be on every retail druggist's tongue at all times.

In matters of legislation the N. A. R. D. is growing in power and gradually attaining a more commanding position. Our efforts in this direction will always be enhanced by the aid of having druggists as members of the various legislative bodies and the N. A. R. D. as well as its affiliated associations must thoroughly awaken to this need.

The growth of the advertising pages of N. A. R. D. Notes is evidence that the trade is more fully appreciating the power of the journal in reaching the retail drug trade. If the journal is not already, it soon will be the recognized medium through which the manufacturer and jobber should carry on their publicity campaigns.

The entire work of the year has been carried on with the utmost harmony, not alone with the officers and employees, but the affiliated associations as well, and your committee foresees, if possible, a brighter and greater future than ever for the N. A. R. D.

This report also was referred to the committee on resolutions.

S. A. Eckstein, of Wisconsin, referred feelingly to the loss to the meeting through the illness of Judge J. W. Errant and Dr. William Muir; and, on motion, a message of condolence was sent to each.

The next order of business was the presentation of resolutions without debate. S. N. Jones, of Kentucky, raised the question of the feasibility of reading those resolutions that had been printed in N. A. R. D. Notes. President Gullford and Mr. Mann opined that they should be read together with all others.

I. M. Light, of Illinois, read nine resolutions submitted under the approval of the Chicago Retail Druggists' Association. Thereupon a motion by J. C. Wallace, of Pennsylvania, prevailed to the effect that the resolutions be

read by title only. Resolutions were presented under the names of the Western Pennsylvania Retail Druggists' Association, the Pennsylvania Pharmaceutical Association, the Ohio Valley Druggists' Association, the Kentucky Pharmaceutical Association, and the Women's Organization of the National Association of Retail Druggists.

J. G. Godding, of Boston, Mass., the president of the American Pharmaceutical Association, was escorted to the platform and introduced by President Guilford. He expressed his pleasure and appreciation of the occasion.

M. P. Welcher, field-secretary of the Anti-Cigarette League, was introduced, and asked the convention to give thought to the use of cigarettes as an influence in juvenile delinquency and social economy generally. J. G. Bone, of Pennsylvania, voiced a hope that the convention would express its opposition to the sale of cigarettes to minors.

Adjournment followed at 12:05 o'clock.

THIRD SITTING.

Tuesday Afternoon.

Again at 2:50 o'clock the convention was in order, and the assistant secretary proceeded with the roll-call of the States for the purpose of securing a record of the names of the delegates selected by the various delegations to serve as their chairmen and representatives upon the committees on resolutions, nominations and finance. This list of names, after subsequent additions had been made, was as follows, the letters before each name designating the positions in which the delegate served:

Colorado—(C and R) C. J. Clayton; (N and F.) L. Wilson.

Connecticut—C. P. Gladding (all).

Delaware—(C and N) Walter Grant; (R) W. L. Morgan; (F) T. B. Cartmell.

District of Columbia—W. S. Richardson (all).

Florida—Ernest Berger (all).

Georgia—(C and F) D. G. Wise; (R) L. E. Pellew; (N) W. S. Elkin, Jr.

Illinois—(C) C. H. Achelpohl; (R) James Wells; (N) J. J. Boehm; (F) R. Dorland.

Indiana—(C) F. W. Meissner; (R) E. W. Stucky; (N) M. A. Stout; (F) C. A. Haupt.

Iowa—H. S. Keables (all).

Kentucky—(C) S. N. Jones; (R) John Hulskamp; (N) J. J. Sieberz; (F) R. L. Cassity.

Louisiana—(C, R and F) G. W. McDuff; (N) A. Di Tripani.

Maryland—G. A. Bunting (all).

Massachusetts—(C and R) W. S. Briery; (N) J. J. Tobin; (F) P. B. Moriarity.

Michigan—(C) J. H. Webster; (R) M. H. Goodale; (N) F. W. R. Perry; (F) E. W. Austin.

Minnesota—(C and R) Stewart Gamble; (N) C. H. Huhn; (F) C. H. Haywood.

Missouri—(C) H. O. Huegel; (R) J. W. Koch; (N) W. A. Buesch; (F) George Ausgen.

New Hampshire—C. J. Whiting (all).

New Jersey—(C and F) T. S. Armstrong; (R) H. B. Weaver; (N) W. E. Warn.

New York—(C) Thomas Stoddart; (R) W. C. Anderson; (N) Joseph Weinstein; (F) C. H. Gillespie.

Ohio—(C) L. C. Hopp; (R) J. C. Otis; (N) F. W. Schneurer; (F) T. C. Haney.

Pennsylvania—(C) D. J. Reese; (R) E. F. Heffner; (N) Charles Rehfuess; (F) W. D. White.

Rhode Island—(C and R) H. I. Leith; (N) A. P. Sanborn; (F) G. S. Morgan.

Texas—Herman Koester (all).

Virginia—J. L. Avis (all).

West Virginia—W. C. Gordon (all).

Wisconsin—(C and R) S. A. Eckstein; (N) Edward Williams; (F) A. R. Eberle.

SECRETARY'S REPORT.

Secretary T. H. Potts then submitted the annual report of his office. This was not quite so voluminous as in recent years, an innovation brought about by an action of the association at its 1910 meeting with a view to expediting the proceedings of the conventions. The summary showed that the association had in affiliated membership 32 State associations, a loss of 3 from the preceding year, and a total affiliated membership of 1038 associations, a gain of 8.

The report testified to the harmonious and frictionless manner in which the various departments of the organization worked together. As usual, the secretary had to complain of spending \$350 in exchange fees on remittances by personal check.

This report was referred in the customary manner.

THOMAS H. POTTS.

Secretary National Association of Retail Druggists.

REPORT OF THE TREASURER.

Printed copies of the report of the treasurer, a voluminous tabulation of names and figures, were distributed to the delegates and others present and Treasurer H. I. Leith, of Providence, R. I., made an abstract report on the year's financial transactions. From this report the following salient features are selected:

	1899.	1900.	1901.
Local dues back.....	No separate account kept for first		
Local dues current.....	No separate account kept for first		
Back State dues.....	Previously included in State dues		
State dues.....	No separate account kept for first		
Advance dues.....	No separate account kept for first		
Total	\$2,062.75	\$4,558.75	\$6,462.00
Organization fees...Included with donations for 1901, 1902 & 1903.			
Donations	\$2,486.40	\$1,092.41	\$13,435.00
Salary refunds.....Formerly included with organization fees.			
Notes			
Advertising			
Interest			
Merchandise			
U. S. P. & N. F. prop- aganda			
Miscellaneous			
	\$4,549.15	\$5,651.16	\$19,897.00
Per capita, State....	25c.	50c.	50c.
Per capita, local....	25c.	50c.	50c.

The number of members in good standing in the various

Local members who paid dues previous to convention.....
*State members whose dues were paid previous to convention..

Total

Local members who paid dues subsequent to convention.....
*State members whose dues were paid previous to convention..

Totals

*Not separated previous to this year.

RECEIPTS.

On hand as per report to Pittsburgh, Pa., convention	\$8,507.55	
Reported in hands of secretary.....	2,000.00	
		\$10,507.55
Back dues.....	\$2,604.00	
1911 dues (does not include "Notes").....	18,475.75	
1912 dues.....	48.00	
Back State dues.....	495.00	
1911 State dues.....	1,456.25	
Organization fees.....	10.00	
Salary refunds.....	160.00	
Donations.....	5.00	
U. S. P. & N. F. propaganda.....	1,032.83	
"Notes" receipts (subscriptions and advertising).....	63,792.45	
Sales department (books and merchandise).....	3,495.00	
Interest.....	180.23	
Miscellaneous (debtors' letters, etc.).....	428.23	
		92,182.74
		\$102,690.29

DISBURSEMENTS.

(As per Vouchers 2073 to 2303 Inclusive.)

Expenses of the secretary's office.....	\$16,009.55	
Expenses of the treasurer's office.....	346.00	
Per diem, mileage, expenses of the executive committee.....	703.18	
Expenses of the organization department.....	17,099.61	
Expenses of the publicity department.....	45,251.90	
Expenses of legal department.....	1,890.90	
Auditing.....	249.98	
Expenses of the U. S. P. and N. F. department.....	3,518.88	
Expenses of legislative committee (stationery, postage and stenographic work).....	150.00	
Expenses of the Pittsburgh convention.....	936.32	
Sales department (books and other merchandise).....	2,626.90	
		88,783.22
Secretary's balance.....	2,000.00	
Treasurer's balance.....	11,907.07	
		13,907.07
		\$102,690.29

Here followed a tabulated statement of the various items of expense in the several offices and departments, and a detailed statement of the money received from affiliated organizations. Summarized under the various States this latter shows the figures given below:

RECEIPTS FROM ASSOCIATIONS IN THE VARIOUS STATES.

1 Illinois.....	\$3,573.00
2 Indiana.....	2,129.00
3 Ohio.....	1,930.00
4 Pennsylvania.....	1,863.75
5 Massachusetts.....	1,739.00
6 Kentucky.....	1,174.50

by F. C. Ullrich, the general organizer. The department had occupied itself chiefly with the revivification of moribund local organizations of druggists, with the spreading of the propaganda in behalf of official medicaments and fraternalism, intra-professional and inter-professional, with collections and rendering assistance in State legislative efforts.

Five and six men were in the field, their efforts securing funds to the amount of \$35,869.54 for the association, \$23,254 as dues and \$12,615.54 for subscriptions to *Notes*. In carrying out its work the department had expended \$20,227.44.

It was the belief of the general organizer that the field force should be increased to ten active men and that he should assist by direct field work.

REPORT OF THE PUBLICITY DEPARTMENT.

C. M. Carr, editor of *N. A. R. D. Notes*, and director of publicity for the association supplemented Mr. Potts with an account of the year's doings in his department. Because of the enforced brevity the report this year did not include a tabulation of earnings. However, it was pointed out that the net earnings of *Notes* had increased from \$3,728.39, in 1908, to \$18,540.55 during the past year, the total earnings in three years being \$48,892.06.

In addition to the publication of *Notes* the department had prepared articles for publication in the public-press, compiled data for use at inter-professional meetings and farmers' institutes, and generally assisted druggists to promulgate desirable publicity.

In conclusion, the report read as follows:

In passing these facts will be of interest as showing progress in the work of the department:

The pre-convention number of *Notes* this year was a 168-page book, including covers, or 32 pages larger than the largest number ever previously issued. It carried more advertising than any previous number ever issued.

The subscription receipts for 1911 show an increase of \$1,060.33 over 1910, and the advertising receipts show an increase of \$5,818.34 for the year just closed over the previous year.

The net cash or surplus shown by the department's balance sheet for the year is \$18,540.55, or an increase over the previous year of \$3,301.56. This is a gratifying showing when we consider that expenses have been largely increased by improving the reading matter contents of *Notes*, installing a weekly cartoon service, increasing the number of paid news correspondents, more profusely illustrating our reading matter, the establishment of a free help wanted and situation wanted department, etc.

It must be remembered in connection with the foregoing facts that *Notes* has the valuable aid of the organizers in the field and that the expense of their maintenance is not charged to this department.

My recommendations are:

First, that *Notes* continue its aggressiveness in support of the policies adopted at each succeeding convention of the *N. A. R. D.*

Second, that the present advertising committee be thanked for their services, and that the advertising committee be continued.

Third, that work of the department dealing with public education be extended through the creation of a public relations committee of the *N. A. R. D.*, of which the director shall be an ex-officio member.

Fourth, that all other matters connected with the administration of the department be committed to the executive committee.

Together with the general report the supplements to the secretary's report were referred in the usual manner, the readers being thanked for their brevity.

At this juncture T. S. Armstrong made a preliminary report for the committee on credentials which was duly received.

ADVERTISING IN NOTES.

The selection, solicitation and supervision of the advertising matter published in *Notes* was the subject of a report presented by J. F. Forbich, of Illinois, chairman of the association's committee on advertising. Mr. Forbich told of a year quite uneventful to the committee because of the solidity of the existing plan for censoring the advertising pages of the association's journal. The committee, the secretary and the editor, he said, were quite in accord in their views upon desirable advertising; so well did they agree that the committee left entirely to the officers named the disposition of medical advertisements of a type agreed upon as unfit.

Despite the more liberal policy now obtaining in the matter of advertising censorship, Mr. Forbich declared, the advertisements submitted for publication in the pages of *Notes* were more rigidly scrutinized than were those of any other drug journal. Because of this, he said, a large amount of business was refused; nevertheless the financial returns were very gratifying.

The committee expressed its surprise at the condition

that the more ethical manufacturing firms left aggressiveness in advertising to the less worthy concerns. It was the opinion of the committee that if the reputable pharmaceutical houses, the manufacturers of apparatus, and the importers of specialties would devote a little more attention to advertising to the drug trade, with a corresponding decrease in their advertising to the medical profession, druggists would extend to them a wider, stronger support which would assure better conditions in pharmacy as a whole.

The committee had no recommendation to make relative to any change in the methods of advertising censorship.

The report was referred to the committee on resolutions.

In the absence of J. W. Errant, general counsel of the association, the following report of the legal department was read by J. C. Wallace, of Pennsylvania:

REPORT OF THE LEGAL DEPARTMENT.

Your general counsel realizes that all that he can hope to accomplish in the matter of presenting a report will be to give a general outline, as it were a sketch, of the work of the legal department during the past year.

GREATER LEGAL DEPARTMENT.

The action of the executive committee following the resolutions adopted by the Pittsburgh convention and formulated at the midyear meeting of that committee has very much enlarged the work of the legal department. The report of the executive committee gives you some idea of the various fields of work which the greater legal department, as outlined by the executive committee, is expected to cover. In brief, that decision means nothing less than a well-organized effort to put at the disposal of our affiliated associations and our dues-paid members the services of the legal department of the *N. A. R. D.*

NEW MOVE APPRECIATED.

That the new move of the executive committee has been very much appreciated is evidenced by the extensive use which has been made of the legal department. The applications coming from associations and especially from members have been quite numerous in the past, but the stimulus of the announcement that the *N. A. R. D.* had created a greater legal department has caused associations and members everywhere to call upon the legal department in numbers steadily increasing with each month. It has not been a question of merely answering some letters. It often means in one case a considerable correspondence resulting in the exact information required or in the doing or attempted doing of some effective piece of work to meet the particular case. The list of subjects presented to us calling for correspondence and assistance of various kinds is a very extensive one indeed.

CO-OPERATION WITH STATES JUST BEGUN.

As the greater legal department was not decided upon by the executive committee until the time of the mid-year meeting, your general counsel did not have the opportunity to co-operate with the various State associations as he should like to have done, but in a number of instances his services were called for and given even to the extent of his being sent to a State capital.

I am happy to say that our services along this line seem to have been very much appreciated and the appreciation expressed indicates that by undertaking this work of co-operation with our affiliated associations, State and local, we are entering upon a most interesting and important field and one which, we believe, will produce far-reaching results. The correspondence with officials of associations and pharmacy boards already indicates the possibilities.

ARTICLES IN NOTES.

As was formerly the case, so during the past year your general counsel has been a regular contributor to *Notes*. During the past year he has made it his object to present to the readers of *Notes* articles which present the larger phases of the work undertaken by the *N. A. R. D.* In these articles he has discussed the meaning and outcome of various movements for which the *N. A. R. D.* stands. He has also reviewed a number of very important decisions rendered by the courts. During the last few months he has employed the space allotted to him in *Notes* by presenting the needs and scope of a legislative conference to be held under the auspices of the *N. A. R. D.*

I am gratified to say that my labors along these lines have resulted in the calling of the legislative conference held in connection with this convention.

COMPENDIUM OF PHARMACY LAWS.

In 1908 I prepared, at the instance of the executive committee, my Compendium of Pharmacy Laws of the United States. This booklet placed before the pharmacists of the country the various State laws relating to the practice of pharmacy. The first edition was very quickly taken up. It is believed that this compendium has had a most helpful influence in suggesting legislation and in emphasizing the great need that exists for making uniform and more up-to-date the pharmacy laws of the various States.

For a number of months past I have been at work on a revision of my compendium. This brings the compendium down to September 1st, 1911, and incorporates all amendments made by State legislatures during their recent sessions. The compendium can be obtained at the convention by making application to the officers in charge of our publications.

NATIONAL LEGISLATION.

The reports of your officers and the committee on legislation have dwelt to a considerable extent on various matters which

interest us in the field of national legislation. Among these are bills now before congress calling for the amendment of the pure food and drugs act, the patent laws and also legislation relating to interstate traffic in narcotics. These are all exceedingly important measures and must be thoroughly studied by us in order that we may be correct in our attitude toward them.

AMENDMENT TO SHERMAN LAW.

Your general counsel feels that the opinions of the supreme court of the United States in the Standard Oil and American Tobacco Company cases have thrown no light on our problems. Nothing less than an entirely new law to take the place of the Sherman law will meet the situation, and when the conferences are held to determine the nature of the new law we must be present and see to it that our particular problems are taken into consideration and covered by the new law.

THE WOOD ALCOHOL PROPOSITION.

Soon after the adjournment of the Pittsburgh convention I took up the resolution of that convention with reference to the adoption of the name "wood naphtha" in place of the names "wood alcohol" or "methyl alcohol." From my investigation I concluded that this was a matter to be taken up by each individual State and Notes published the bill suggested by me for adoption by the various States.

CONSTITUTION AND BY-LAWS FOR AFFILIATED ASSOCIATIONS.

For some time past I have been at work on a draft of a constitution and by-laws for affiliated associations. As soon as this draft is in shape it will be submitted, and it is hoped that it will be helpful to associations just adopting a constitution and by-laws and also to associations desiring to make changes in such constitutions and by-laws as they may now have.

THE PAST AND THE FUTURE.

Your general counsel has always enjoyed the work which he is doing for this association. He feels that twenty years of service in the cause of the retail druggist have placed him in a position to understand thoroughly and sympathetically the life and work of the retail druggist. In fact, he feels that in his capacity to render sympathetic service there lies a large part of the strength which he has been able to give to the cause of the retail druggist. For all that your friendship and loyal support has meant for me in the past, I thank you.

The development of the greater legal department has very much enlarged my field of work. The new duties mean enlarged responsibilities. The new duties mean the facing of constructive tasks which will tax to the utmost whatever ability has been given me. I shall need your patience and forbearance. I shall seek your aid and your co-operation. I shall ask this of you in behalf of the cause in which we are all interested and for which we have enlisted. And as I face the larger tasks I give you my pledge that I shall, in the future as in the past, give to the cause the best that is in me with an eye single to your best interests and always having in mind the advancement of the cause of pharmacy.

This report being a supplement to the report of the secretary was referred with that communication.

Several additional resolutions were presented by title; the assistant secretary made some announcements; the chair stated the time for the organization meetings of the committees on resolutions, nominations, and finance; and the sitting was adjourned at 4:22 o'clock.

FOURTH SITTING.

Wednesday Forenoon.

The fourth sitting was begun at 10:10 o'clock Wednesday morning, the first order of business being the reading of the report of the committee on fraternal relations. This report, which was read by Herman Koester, of Texas, a member of the committee, had to do entirely with the question of Sunday rest for druggists. In it were recounted the action of the Pennsylvania and the New Jersey State associations which at their 1911 meetings urged their members to close their stores, partially at least, on Sundays. There were also reviewed the utterances of several prominent pharmaceutical workers who had endeavored to point out the unwisdom of working all day Sunday. The report concluded thus: "Brother pharmacists: We believe the time has arrived for the general adoption of the Sunday closing plan, and therefore we earnestly appeal to you, to every individual member of our profession, nobly to do your part toward the proper observance of the day of rest."

The report was referred in the customary manner.

J. G. Bone, of Pennsylvania, spoke for several minutes in behalf of Sunday closing, and to point out the benefits of the Sunday rest.

A few announcements were made by the assistant secretary. T. S. Armstrong made a second preliminary report for the committee on credentials.

TELEPHONE CONDITIONS.

As the next order of business came the report of the committee on telephones. This was presented by Chairman Wilhelm Bodemann, of Illinois, and was as follows:

Chemistry presents many incompatibilities, but none so incongruous, none so unexplainable, so unfathomable as arise in the study of the telephone question.

In spite of the widely read advertisements in Notes, appealing to the support of our people, asking for their help to spread the pay system, in spite of personal letters to our organizers, to local secretaries and in spite of our attempts in other directions to have a full report on the present telephone situation from the different local associations, the answers we received were so few that we can as well say we received none—except the one so familiar to readers of Poe, "Quoth the Raven: 'Nevermore.'"

When we directed our efforts for information through other channels, we were as much as told by the telephone companies that there was no information available, and yet we did not seek this information for any other purpose than the one that called our committee into existence, the spread of the pay phone system.

EDUCATION NECESSARY.

We are amazed at this condition and again come to the conclusion that the telephone companies, as well as the druggists, need this campaign of education. When we consider that the druggists of Chicago alone made several millions of dollars by this innovation and that the company made two to every one we made, we can not conceive how druggists and telephone companies in other cities can shut their eyes toward this available improvement of the service as well as the finances of both parties to the deal.

May we view this tragedy from a physiological, psychological, pathological or purely financial viewpoint; under the pure food act we can not find the proper label for this disease, if it is not shortsightedness, crosseyedness, astigmatism, or color-blindness.

RECORDS UNAVAILABLE.

We have been in hopes to give this year a full and complete record of the conditions in all leading cities, the above is the reason why we failed.

EXPERIENCES.

Let us quote a few instances of our experience. In one city, which unfortunately has two companies, we succeeded in a most unparalleled manner to have all druggists sign up for the pay system, and they did so without any help, except advice from your committee and your organization force. When the day came to install the service, the second company got the newspapers of the town to kick up a terrible rumpus and for a week or two there was the dickens to pay. Then the druggists got cold feet and the booths, already installed in the stores, went out and that was the end of it. It is our honest conviction that had a man been on the ground to instill backbone into the spinal cords of our people, they would to-day enjoy the same privileges as those cities do who have installed the pay system.

Another city applied to us for assistance and advice. We succeeded in getting from the telephone company in that city a fair proposition, which was sent to the association officers. One of these officers went out on a three months' vacation, another officer's term expired and after months of correspondence, it was ascertained that the company's proposition had been sent to the officer on a vacation, returned to the officer who had stepped out and that, as a matter of fact, the document got lost in the shuffle. A copy of this proposition was obtained and sent out to this city and we did not hear a word until about twelve months later, when we learned that the system had been installed, proved a big success, but not a word was sent to your committee. Pray, in all fairness and decency, what would you label such brilliant eruption of indifference?

Another city saw the ads. in Notes, concluded that they wanted the pay system and got it.

Here are three typical cases of the job lot of varieties of the fifty-nine varieties of our experiences.

Now comes a refreshing picture from Baltimore. Mr. Kahn is the artist who deserves great credit for his part.

Baltimore with 350 druggists suffered all kinds of deadbeat conditions regarding telephone service and now let me quote Mr. Kahn, the artist of this Baltimore picture: "Some were paying a large rental and had no income, while others were getting a small percentage. Through the good work of the N. A. R. D., I got our local committee together and after a great many meetings with the telephone company, we managed to get slot machines for every druggist, and after many more meetings, in June, 1910, we got 20 per cent. on all coin taken in."

What seems singular is that the treasurer's report does not show Baltimore as contributing liberally, taking into consideration the excellent results accomplished on 'phone matters alone. Are the druggists really appreciative? If not, what's the cause? Kahn, Hynson, Williamson, and others are good association men, and as Baltimore druggists have been shown what can be done, we hope next year will see Baltimore represented by double its present membership.

Our friend Kahn is deserving of special mention for his earnest endeavor to improve conditions in Baltimore.

KANSAS CITY.

A demonstration of the druggists' influence and strength was manifested at Kansas City a few years ago. At the time referred to, the Bell Telephone Company had a monopoly and took it upon themselves to demand rates of the druggists, which were considered unreasonable. As chance would have it, an independent company was scratching for a foothold and the druggists took upon themselves the responsibility of throwing out the Bell phones and installing the independent. In the matter of one short year, the subscribers of the independent company exceeded those of the Bell and it is generally conceded that it was the druggists who made it possible.

This brought two telephone companies into the field, which in later years has been recognized as inimical to the best interests of all concerned.

The general organizer, when last in Kansas City, succeeded in bringing the two warring factions together and an understanding was arrived at. To-day efforts are being made to consolidate the two companies under the Bell management and

the druggists are co-operating with this end in view and when the consolidation is brought about, which from statistics at hand, looks favorable of being done at an early date, the druggists will have the slot phone under a favorable arrangement.

DALLAS, TEXAS.

Dallas, Texas, offers an excellent opportunity to bring about the installation of the slot phone, although a former attempt failed, but that was before the N. A. R. D. organized the druggists this year into an active local association. All the Dallas retail druggists are receiving Notes and are learning the error of their way, besides the telephone management is friendly and if we had some man familiar with the organization game who could spare a couple of months, he undoubtedly would bring the warring factions together and the druggists would live happily ever afterwards.

REACTIONARY METHODS.

Last year's convention enjoined our committee chairmen to cut it short in our reports. We shall try to do so, but we must mention this matter of public utility commissions in different States. Telephone companies are put down as common carriers and these commissions are to establish as low rates as possible. In several States these commissions are now at work and I will explain verbally some of the peculiar features of this two edged sword and this explanation will account in some measure why it is not expedient to press our claims at this present stage of the game, and after this verbal explanation you may perhaps account in some measure for the latest development—the apparent attempt to cut down established rates or commissions.

The first we heard of this was in Brooklyn, then Buffalo and then Rochester. Buffalo has applied the correct remedy, a stiff, concerted upper lip and a corresponding stiff vertebra, nursed by an able local committee and an N. A. R. D. organizer, and if they succeed in discovering a serum to equip the rank and file with unanimous opposition, we are of the opinion that the new discovered serum for the upper lip should be named after the Buffalo committeeman, Smitherine, and for the vertebra, Stoddartine, and we don't care if they take out a patent and command a big royalty for the stuff that brings the stuff.

WHAT IS NEEDED.

We can not remain idle towards this new danger and we recommend that the executive committee in conference with the telephone committee devise means and ways to head off this encroachment. We druggists have pulled the chestnuts out of the coals for the companies repeatedly and are entitled to better treatment than cutting down rates. We want an upward, not a downward, revision of telephone commission tariff and we venture another recommendation—a repetition of a similar one made every year. We urge the executive committee, in connection with the incoming telephone committee, to establish a telephone department in our organization department, a one man affair.

One man, experienced in the arts of a shrewd traveling salesman, conversant with the trade and the telephone situation, should have charge of the active propaganda, under the lead of the national telephone committee. This man should be young in years, old in experience with men and affairs, be a man of character, good personal appearance, diplomatic and wide awake. He could and should go out to the cities needing him and direct the campaign by personally keeping the forces together.

This telephone organizer should not be a telephone man, but should be an N. A. R. D. telephone organizer, and our executive committee, in connection with the telephone committee, should again try to make the telephone company pay for this part of the organization, for merely telephone benefits. As we stated before, to every dollar we make, the company makes two and three dollars and we should see to it that he who dances pays for the fiddler.

How this can be brought about, we earnestly beg the new executive committee to study and not to be discouraged at the failure of former attempts to solve the problem.

ORGANIZER NEEDED.

The great trouble is that our people in different cities are not a unit. Several large cities are ready to put in pay phones, IP (this significant big, little word) a few downtown men are willing, but these big downtown men are not willing for the same reasons as they were and are unwilling to adopt full prices, they want to be cutters for advertising purposes. These men should be either won over or shown by an object lesson that they can be gotten along without.

We hope that the system can be installed without them and if done by our prospective organizer, these big stiffies would soon come into the reservation and make a great deal more money by being good, rather than being ugly Indians.

Since the late, lamented MacDonald is no longer our mainstay, your committee has more than ever been compelled to lean on the national office and it is only due our able secretary, T. H. Potts, and since it comes under the organization department, especially due to our ever willing, ready general organizer, F. C. Ullrich, that we publicly and emphatically file and register our most sincere appreciation of their help. Both officers have repeatedly called with your chairman on the Chicago telephone officials, who advised and helped us in our efforts to grant other cities the same splendid privileges that Chicago enjoys since 1895. If we succeeded only in part, fate was against us, in partnership with that unspeakable indolence and unfathomable lethargy exhibited by the retail drug trade. Had we offered them a gold brick, we believe they would have jumped all over themselves to come in, but alas, it was not thus to be.

In connection with his report, Mr. Bodemann presented two resolutions dealing with the telephone question, and these were duly referred.

As a supplement to Mr. Bodemann's report, D. J. Reese,

of Pennsylvania, a member of the committee on telephones, told of the conditions obtaining in Philadelphia. He quoted from a letter written by a telephone official in which it was pointed out that by adding a little to their telephone equipment many drug store proprietors would increase their income from telephone commissions several hundred dollars a year. Mr. Reese had tabulated the earnings of twenty drug stores before and after they had been equipped with enclosed booths and window booths. These figures showed that the telephone commissions were in some instances more than doubled, and even trebled.

In the Quaker City, according to Mr. Reese, the druggists are on good terms with both telephone companies, and the telephone concerns have spent over \$40,000 in the past eighteen months for improved equipment.

The committee on form of organization stated that it had nothing to report.

W. G. Freeman, of the Freeman Perfume Company, was introduced by the president and spoke on price protection. He opined that the general adoption of a certificate agency plan would result in the enrollment of all jobbers and retailers in opposition to price cutting. If the N. A. R. D., said he, will hallo loud enough for some such plan, manufacturers and proprietors will have to adopt it or be wiped out.

S. A. Eckstein, of Wisconsin, reported preliminarily for the committee on transportation, about the validation of reduced rate return certificates.

D. N. Robin, of Pittsburgh, Pa., president of the National Association of Pharmacologists, was introduced. He read an able paper on "The Conditions of the Drug Clerk," in which he held that it was better to be a satisfied employee than a bankrupt proprietor. Several resolutions embraced in the paper were duly referred.

A few announcements were made by the assistant secretary; several telegrams were read; another resolution was submitted; and the sitting was adjourned at 11:35 o'clock.

FIFTH SITTING.

Wednesday Afternoon.

It was 2.55 p. m. when the convention was next called to order, and the assistant secretary began the roll call of States to permit the presentation of resolutions affecting the plans and policies of the association. Because of the opportunities to offer resolutions at previous sittings there was but one presented at this time, J. C. Wallace, of Pennsylvania, submitting it.

REPORT ON NATIONAL LEGISLATION.

In matters of legislation the year 1910-11 had not differed much from previous years, reported the committee on national legislation through its chairman, W. S. Richardson, of the District of Columbia. As usual in congress as in the State law-making halls pharmacical interests had been affected in a large number of measures, and the committee, in its endeavor to safeguard the interests of the druggists in national legislative efforts and to lend aid in local and State legislative considerations, had been much engaged. In national circles, the measures given attention by the committee were: A bill regulating the pay and mode of appointment of pharmacists in the public health and marine-hospital service; several bills providing for a parcels post; several bills intended to reform the patent laws; a bill to create a department of public health; a bill to amend the Sherman anti-trust law; a bill to tax medicinal proprietaries; several bills to regulate the sale and transportation of narcotic and habit-forming drugs; and a bill to amend the pure food and drugs act. The committee had also given thought to the question of getting a distinctive official name for methyl alcohol.

Concerning these several matters the committee reported as follows:

PHARMACISTS IN THE PUBLIC HEALTH AND MARINE-HOSPITAL SERVICE.

This bill was pending during the last session of the sixty-first congress before the same committee as that of the public health department bill. There being no prospect of getting either one of these bills through the last session of congress, your committee made no further efforts to have the bill to regulate the pay and mode of appointment of pharmacists in the public health and marine-hospital service passed. We believe from the past year's experience that the best way to get proper recognition of the druggists in the government employ is to petition the president, clearly setting forth the humiliating position of the druggists in the government service. Your chairman sincerely believes that the president has no idea

that our profession is humiliated in the different departments in the manner in which it is to-day. Your committee is of the opinion that if the president knew the situation, he would recommend that congress take some action looking towards relief of the pharmacists in the different government departments.

PARCELS POST.

There were several parcels-post bills pending during the last session of the sixty-first congress, some of which were for a general parcels post, others for a limited parcels post, and still others for an experimental parcels post. Your committee kept a close watch over the post office appropriation bill while it was under consideration, for fear that the parcels post rider might be again attached to it in the same manner that had been done in previous congresses. But our good friends in congress seemed to be able to prevent this same old trick from being done. During the special session of the sixty-first congress these same varieties of parcels-post bills were reintroduced. While it was generally expected that no committee, except that one having charge of tariff bills, would consider any bills at this special session, yet almost without warning, your chairman learned that the post office committee would take up the subject of parcels post and give a public hearing on it. As soon as this became known your committee immediately set to work to prepare itself to oppose the parcels post; we appeared before congress at this hearing and explained to them why we opposed it. This hearing, like previous ones, brought out the combined force and power of national associations of business men representing the different kinds of business interests. The different representative business men pleaded very hard against any form of parcels post. It will be of utmost importance during the coming session of congress for this committee to keep a very watchful eye on these bills as your committee believes that the real promoters of this obnoxious measure are large commercial concerns who are determined to crush out small dealers all over the country and with the assistance of the government still further concentrate the trade of this country. This feature of the scheme was placed very forcibly before the post-office committee.

PATENT LAW REFORM.

There were several bills pending during this sixty-first congress in reference to making changes in the existing patent laws. While most of these bills proposed to change the working plans in the office of the commissioner of patents, one of them that was before the committee was the bill that we have so long cherished—to prevent a foreigner from getting more rights from this country than his country gives an American citizen. These bills failed to pass congress during the last session, but have been reintroduced together with our bill. Your committee reintroduced what was known as the Currier bill and believes that we should continue to ask congress to put a stop to this great injustice to American citizens, namely, the granting of more rights to foreigners having patents in this country than what their countries would give to Americans holding patents under their patent laws.

It has been rumored around the halls of congress that the new patent committee will make a strong attempt to reform several features of our patent law.

TO CHANGE THE NAME OF WOOD ALCOHOL.

A resolution to change the name of wood alcohol to "wood naphtha" is a subject that has required some study as to the best method of procedure and also as to the constitutional feature of it. Your chairman interviewed several government officials in regard to this, and while they agreed with him that it would be a good move and ought to be done, it being a new subject to them, they were not prepared to give him very much information. At first it was thought that an amendment to the pure food and drugs act covering this feature might be the easiest solution of it. After studying that point your chairman soon realized that owing to a number of court decisions on the pure food and drugs act, a bill to amend this act would probably soon be presented to congress, and if it should develop that it would be most feasible to attach the wood alcohol amendment to the pure food and drugs act, your committee thought that then would be the most opportune time to make the change. After corresponding with our attorney your chairman made some inquiries from a member of congress and learned that there could be no possible chance of getting a bill through congress at this session as they would not be able to take up and pass a large number of important bills then pending.

From the study made on this subject by our attorney he will probably be able to make some valuable suggestions as to the best way to proceed on this resolution during the coming year.

DEPARTMENT OF PUBLIC HEALTH.

There was pending at the beginning of the last session of the sixty-first congress a bill to create a department of public health. This bill had been given a public hearing in the previous session and was fully reported upon in last year's report of this committee at the Pittsburgh convention. Although this bill had very strong backing and a great deal of influence was brought to bear upon congress in its favor, still it failed to pass this session. As we have said before, this bill shared the same fate as many other important bills did. As this committee stated in last year's report, it cannot see why it is not feasible to have all matters pertaining to health combined under one bureau or department with the physician and druggist working in harmony, as the interests of each are closely allied, but do not trample on each other.

Your chairman has always believed that a closer union of physician and druggist is a material aid to both. This bill was reintroduced at the special session of congress and has the honor of being listed as bill No. 1 in the senate. This committee recommends that we should insist, provided this bill passes, that there be created a bureau of pharmacy and chemistry with a pharmacist at its head, and we believe that a strong effort will be made to pass this bill during the coming session. As science to-day is putting forth strong efforts in investigating the causes of diseases and how best to prevent

them, it has increased the necessity of combining under one head all activities relating to medical and pharmaceutical pursuits.

CHANGE IN ANTI-TRUST LAW.

Nothing was done during the past session toward taking up or considering any measure to amend the Sherman anti-trust law, for congress as well as every individual was awaiting with a great deal of anxiety to learn what the decisions in the supreme court would be on those important cases that were then pending. These decisions will probably determine just what future course shall be pursued, if any shall be taken, to amend this act. Our attorney will probably give a history of these cases and show how this decision affects the retail druggist and may recommend what is the best course to pursue.

TAX ON MEDICINAL PROPRIETARIES.

There was introduced during the special session of congress a bill which became widely known as the Sherrey bill and which affects every retail druggist in the United States. This bill proposed to revive that part of the old Spanish war tax which imposed a tax on all proprietaries handled by the retail druggist. The results of that tax are still fresh in the minds of all those who shared in the taxation. Through his loyalty to his country and his knowledge of the necessity of taxation on all kinds of business in war time, the druggist accepted the burden at that time without complaint. Now to reimpose this burden upon the already overtaxed and burdened druggist seems an unjust, unwarranted and unnecessary taxation. As soon as your committee learned of this bill they immediately put their machinery in operation to show their strong protestation against it and to use every possible means, if necessary, to prevent this burden being reimposed on the retail druggists. When you realize that there are over 400 members of congress who have a right to vote upon this measure and perhaps some of these strongly urging the passage of it, you can readily see the task that was before this committee to take up and defeat such a measure. This committee feels very grateful to a number of local and State associations who immediately took up this matter, offering their aid to your committee and also notifying the members from their districts that they were very much opposed to such legislation. This committee filed with different members of congress several strong petitions which it received from druggists in different States. While it seems that this bill will probably never be reported from the committee, it will be necessary for this committee and the retail trade to keep a close watch over it during the coming session of congress.

SALES AND TRANSPORTATION OF NARCOTIC AND HABIT-FORMING DRUGS.

During the last session of the sixty-first congress there were several bills pending to regulate the sales and transportation of narcotic and habit-forming drugs. One that was widely known and received the attention of the committee was known as the Foster bill. While this bill received much criticism, undoubtedly much of it came from misunderstanding the motive of the bill or perhaps from someone who might possibly be hurt. This bill, which originated in the State department, had for its purpose the restriction of the sale of narcotic and habit-forming drugs while in interstate commerce, and did not restrict local sales within a State, as all such sales are subject to regulations prescribed by the State itself. This bill seemed perhaps a little severe at first, but experience has proven that there must be some perfect method to determine who should sell these drugs and also to know whose hands they pass through. It was brought out at the hearing on this bill that 75 per cent. or more of the morphine that was sold was used outside of legitimate medicinal purposes. There is every reason to believe and good evidence to show that this abominable traffic had been carried on outside of the retail drug trade. This bill would have confined the sales and uses of these drugs to the retail drug trade and for strict medicinal purposes only.

The transportation of these drugs in interstate commerce without registration or identification has handicapped many States which have most admirable laws for controlling the traffic in these drugs. The president in his special message to congress requested that a suitable law be passed to regulate the traffic in these drugs. The bill to regulate the sale and transportation of narcotic and habit-forming drugs came up for a hearing before the ways and means committee during the last days of the sixty-first congress. While it was opposed by certain interests who did not deny the necessity for regulation of the traffic in these drugs, it was claimed by them that it placed a burden upon dealers in the keeping of a record of these sales, as there were such a large number of remedies on the market containing various amounts of these drugs. Many authorities have stated that, if this bill had passed, the larger portion of these remedies would have either passed off the market or their formulas would have been so changed as to eliminate these drugs. This is probably true, as the tendency to-day even among physicians is to use less and less of narcotic drugs. This bill received strong endorsement from government departments and from a number of pharmaceutical associations. The necessity for some regulation by which the sales and uses of these drugs might be kept within their proper medicinal sphere was clearly set forth.

The chairman of your committee has every reason to believe that if the committee before whom this hearing took place had had time in which to frame a report on this bill it would have been in such shape that there would not have been the hardship on the retail druggist that many had been led to believe. The author of this bill and our association are in perfect harmony and this bill would have come from the committee in good shape. I want to say right here that the author of this bill does not want to impose any more work on the druggist than is necessary to prevent the indiscriminate sales and transportation of these abominable narcotic and habit-forming drugs. Information was given at the hearing showing that foreign countries were imposing restrictions on the sales of this

class of drugs and curtailing the output of them. Even China, who derived a great revenue from these drugs, is restricting the production of opium. I believe that there is a mutual understanding between all nations to use their utmost efforts to curtail the sales of these drugs. Why should we not fall in line and do likewise? As this bill failed to pass the last session it will be reintroduced into congress and the author of it, I am sure, will be glad to receive suggestions, as he has already requested this of your chairman. Knowing that we were to have a legislative conference during this convention, your committee thought it best to place this matter before the conference, believing that in this way many valuable suggestions would be brought out. Your committee believes that the passage of an anti-narcotic bill with proper restrictions will not only rid this country of a class of illicit dealers in this nefarious traffic who are worse than pirates, but it will also place both the medical and pharmaceutical professions on a higher plane.

AMENDING FOOD AND DRUG ACT.

The enforcement of the pure food and drug act has brought to our shelves a higher class of drugs and chemicals than ever before, and which we are selling to-day with a feeling of security and confidence that they are of the proper strength and purity. But owing to a number of recent court decisions this act has lost a great deal of the force or protection that it was supposed to have in protecting the public against the false claims of nostrums which druggists have always protested against and which the country is flooded with. The public can be imposed upon just as much by false claims as it can by drugs that do not come up to the standard required by the pure food and drugs act. During the special session of congress a bill was introduced by Congressman Richardson to amend the pure food and drugs act. While this bill takes up several features of the pure food and drugs act, one strong feature in it is that it would probably be a severe blow to nostrums that make outrageous claims as to their curative properties. It seems to your committee that a regulation of this kind cannot hurt an honest medicinal preparation. It looks as if it would be an invitation to the manufacturers of fake remedies to get off the earth.

We think that during this coming congress we should take up this pure food and drugs act, as now is the time to take action if there be a necessity for strengthening any weak points that may exist in it. This act undoubtedly is of vital importance to the retail trade and something should be done, for as it now stands it seems that any person can make any concoction and make any claim that he may choose on labels, or on circulars, by advertising, or in any other way, and still be immune. We must at the same time in making our ethical preparations see that they conform in every particular with the standard laid down by the U. S. P. and N. F. While this bill will probably meet with a great deal of opposition from certain quarters, your committee does not believe that this proposed bill can hurt simple household remedies that are put up by druggists, as they seldom make any claim other than that they are certain remedies for certain ailments. The druggist has always been up against those unwarranted claims of certain preparations that he is obliged to carry in stock owing to the publicity which they receive by advertising. Another feature of the bill proposes to place the manufacturing and sales of all medicinal preparations in the hands of pharmacists. This is strictly in line with the law governing the practice of medicine which properly places the prescribing and treatment of diseases in the hands of physicians. Another feature is that it greatly increases the list of drugs and chemicals that must be specified on the label. It is a question whether we should have a long list of drugs or a few of the more important ones exposed on the label to the public. While we make no recommendation on this we hope that the legislative conference will take up this feature as well as others that may be suggested. In amending the pure food and drugs act I think that we should go over it very carefully. With the experience of the past three or four years the defining of weak and strong points in this act, and with our knowledge of the working of the law, we are in a position to aid in amending it into a perfect law.

As the committee saw it, the legislative program of the association for the ensuing year should be based on the following recommendations:

That the committee on national legislation be appointed as soon as possible after each year's convention.

That we petition the president of the United States to request congress to take some action toward the relief of the pharmacists in the different government positions.

That all parcels-post bills continue to receive the vigorous opposition of the retail drug trade.

That the patent laws be amended in accordance with the well established views of the association as outlined in its conventions for several years.

That the association use its efforts to have passed an interstate anti-narcotic law, the terms of which will prohibit all illegitimate traffic in narcotic and habit-forming drugs and confine their sales and uses to proper channels and strictly medicinal purposes.

That we favor an amendment to the Sherman anti-trust law so that this act will not interfere with the welfare of the small merchant who seeks protection and not destruction from large monopolies.

That the bill to place a tax on proprietary medicines be vigorously opposed.

That the pure food and drugs act be amended so as to protect the public against unwarranted claims of nostrums and be further amended so that the manufacturing of medicinal preparations be in the hands of pharmacists.

It had been the committee's experience that organizations in other retail trades were more inclined to co-operate with the N. A. R. D. than the various drug organiza-

tions were to work in harmony. In the committee's opinion the coming year will be one of legislative moment to druggists, and it believed that the association should enter the field of legislative activity especially prepared for hard work. The report was referred as usual.

CONFERENCE ON LEGISLATION.

In accordance with the plans for the meeting, President Guilford at this time relinquished the chair in favor of Chairman Richardson and the sitting was resolved into a general legislative conference. In the absence of the general counsel, Judge J. W. Errant, F. H. Freericks, Esq., of Cincinnati, Ohio, officiated as legal advisor.

Parcels-post bills were first considered, but only briefly, as it was conceded that the opposition of the drug trade was so thorough as to preclude all discussion. There was no echo of the action of the Michigan Pharmaceutical Association in favoring the parcels-post project.

THE LABELING OF WOOD SPIRIT.

The next matter to be considered was the advisability and practicability of furthering legislation to assure a distinctive name for wood spirit. Secretary T. H. Potts said that he had been advised by Judge Errant that the feasible plan would be to secure State laws as to labeling. He thought the subject a most vital one and could see no reason for opposition to adopting the name "wood naphtha." Stewart Gamble, of Minnesota, stated that it had been no trouble to pass such a law in his State.

J. C. Wallace, of Pennsylvania, was opposed to any hasty action. He was in doubt as to the dangers of the external use of the spirit; knew that workers in the wood spirit industry suffered no injurious effects; and disapproved of the threatened injury to the considerable industry represented in the production of the spirit, if unwarranted.

T. S. Armstrong, of New Jersey, told of a case of blindness he knew to have followed the drinking of wood spirit. He had often felt the effects upon his eyes of burning the spirit in a lamp, and said that painters could not work long with varnishes containing the methyl variety of alcohol. W. C. Anderson, of New York, said that there had been many instances of harm following the use of wood spirit through a confusion of names. He did not believe that the changing of the name of the spirit would seriously affect the producing industry, and, at any event, the convention was concerned with the welfare of the public rather than that of any industry. S. N. Jones, of Kentucky, thought that the food and drugs act might be amended so as to afford some assistance. He cited the fact that the use of denatured alcohol in medicinal and toilet preparations is prohibited by the internal revenue department. F. W. Meissner, of Indiana, could imagine no argument in favor of the medicinal use of the spirit, even externally. It is not authorized in any official preparation and should be tabooed. As to the effect of a change in the name, he referred to the fact that under special names the spirit is widely sold at the present time. E. W. Sticky, of Indiana, said that to have saved the lives of five persons and the sight of another, all recent victims of wood spirit drinking in a small Indiana town, would have been warrant enough for any law that would safeguard the public in the sale of the spirit. Joseph Weinstein, of New York, referred to many poisonings by methylated "whisky" in this city. He pointed out that the dispensaries referred to blindness caused by the vapors from the fluid. Wilhelm Bodemann, of Illinois, said that a Chicago scientist was now blind because of personal experimentation with the effects of wood spirit.

Louis Emanuel, of Pennsylvania, suggested that the association ask the pharmacopoeial revisers to give wood spirit official recognition under the name "wood naphtha." B. E. Pritchard, of Pennsylvania, thought that all members of the association should be instructed to label each container in which wood spirit was sold "wood naphtha" and "poison."

ABOUT A DEPARTMENT OF PUBLIC HEALTH.

Mr. Freericks read the Owen bill to establish a federal government supervision of matters of health. Then, pointing out the importance of the project to pharmacists, he called the attention of his hearers to the fact that the bill extended no recognition to pharmacy, bracketed drugs with foods, and had no reference to chemistry. These points, and the apparently powerless condition in which the advisory board was left and the fact that no qualifications were fixed for the director, to him seemed worthy of discussion.

Mr. Wallace and Mr. Huhn were of the opinion that the bill should be condemned by resolution, and efforts then made to get a satisfactory measure. Mr. Anderson urged the association to demand recognition for druggists with the doctors in the proposed conference to formulate a practicable plan for the new department. J. F. Guerin, of Massachusetts, advised the druggists to oppose strenuously any tendency toward a one-man power. Get things your way first, said he, then favor the entire project. Thomas Stoddart, of New York, was in favor of combining the existing federal offices that have to do with matters of health, but did not approve of the formation of a new cabinet office.

C. M. Carr, editor of *Notes*, wanted to know if any druggist had ever gotten anything of benefit from local or State health boards. It was his opinion that no druggist wanted a federal department of health, but none would oppose it if pharmacy was properly recognized in its establishment. C. L. Hay, of Pennsylvania, said that the department of health would come in spite of any position taken by the association. The thing to do was to get a legislative committee that could and would "scrap" and "gouge" out what the druggists want.

Others discussing the Owen bill were Messrs. Shuptrine, Gladding, Meissner, Armstrong, and Richardson.

In introducing the subject of the interstate restriction of the narcotic traffic, Chairman Richardson said that the next session of congress would consider a measure very like the Foster bill, and it behooved druggists to look into the proposed features.

Mr. Stoddart wished to know why the attempt was made to place the supervision of the traffic with the internal revenue bureau. He thought that the State governments had sufficient power to regulate the traffic. Mr. Richardson explained that only the revenue bureau had an adequately equipped service for tracing shipments of drugs; and as this bureau has not police power it was necessary to include a license fee so as to give the bureau control through collections. He had been assured that the retail druggist's license to handle liquors would be extended to cover the handling of drugs.

Secretary Potts saw in this latter fact an opportunity to free the druggist from federal classification as a retail liquor dealer. But R. K. Smithers, of New York, was of the opinion that the liquor-dealer stigma was being over-worked chiefly by surreptitious sellers of liquor, and said that he sold liquor for medicinal purposes and would rather be licensed as a liquor seller than as a dope seller. Mr. Potts replied that there were many druggists who sold no liquor and objected to being taxed for handling alcohol.

Mr. Freericks explained in detail why the plan of placing the supervision of the narcotic traffic with the internal revenue bureau was decided upon and how this supervision would assist the State authorities in curbing the narcotic evil. Mr. Wallace saw in the plan a source of much aid to the State boards of pharmacy. Messrs. Armstrong, Walton, Wilson, Finneran, and Zuber also spoke.

AMENDING THE FOOD AND DRUGS ACT.

Mr. Freericks read the Richardson bill designed to extend the scope of the federal food and drugs act, and explained the import of the new provisions. There was no discussion.

The conference was thereupon dissolved; and President Guilford resumed the chair, subsequently adjourning the sitting at 5:40 o'clock.

OPEN MEETING OF THE COMMITTEE ON RESOLUTIONS.

Wednesday Evening.

In the customary manner of procedure the discussion of steps to be taken by the convention came about on Wednesday evening at an open meeting of the committee on resolutions. W. C. Anderson, of New York, chairman of the committee, presided; and E. F. Heffner, of Pennsylvania, acted as secretary. The meeting began at 8:10 p. m.

First to be considered were the recommendations in the president's annual message. None of these were commented upon when read by the secretary, with the exception of the suggestion that a contribution to the Procter memorial fund be made; this was commended.

QUALIFICATIONS OF DELEGATES.

Of the recommendations made by the executive committee, one only was discussed; that had to do with the definition of "actively engaged in the retail drug business" as

applied to delegates to the conventions. Chairman Anderson thought that the qualifications of the delegates would best be left to the delegating organizations, which should be instructed to select their representatives with care.

H. I. Leith, of Rhode Island, said that the credentials committee had once decided that an investor in the retail drug business was duly qualified. He thought that the delegates should be persons taking a part in the regular business of a drug store. M. A. Stout, of Indiana, and J. F. Finneran, of Massachusetts, expressed a similar view; the latter believed it best to put the decision up to the delegating body.

Commenting upon the recommendation by the organization department that more organizers be employed, J. F. Guerin, of Massachusetts, said that a personal talk by a field representative was immeasurably better than letters in arousing interest in local organizations.

SUNDAY CLOSING.

The matter of Sunday closing came up in a recommendation in the report of the committee on fraternal relations. W. E. Lee, of Pennsylvania, opined that this was entirely a matter of the individual. He told how he had secured Sunday rest for himself. B. E. Pritchard, of Pennsylvania, said that the reason for the recurrence of this question was because the druggist did not want to close. He had been unanimously opposed by his fellow druggists in an effort to make partial Sunday closing compulsory by law. Sunday work he declared was one of the chief reasons for the difficulty of getting high-grade apprentices; yet any druggist could close up if he would. In Pittsburgh, he said, the biggest stores are not open on Sundays, and are open only ten hours on other days.

H. B. Weaver, of New Jersey, and C. P. Gladding, of Connecticut, told that in their towns the druggists who wanted to get some rest on Sunday were doing so without losing any money.

ANTI-NARCOTIC LEGISLATION.

The consideration of the stand to be taken with regard to interstate traffic in narcotic and habit-forming drugs, brought out from F. A. Hubbard, of Massachusetts, a caution against too general terms in laws. He referred particularly to the undefined classification "habit-forming drugs," and thought that any proposed measure should specify the drugs referred to. Mr. Anderson thought that the list given in the food and drugs act with the addition of caffeine and perhaps one or two others, would be the ones included in an anti-narcotic law.

A Pennsylvania member expressed the belief that the habit-formers should be specifically named, as spirit of pepper mint and Hoffman's anodyne could justly be called habit-forming. J. F. Finneran, of Massachusetts, said that the "uplift" societies would make a strong effort to have the law embrace a large number of drugs, and it was up to the druggists to convince the law-makers that many of these substances were wrongly included among habit-forming drugs. The law, as he saw it, should be particularly specific.

RATIO OF REPRESENTATION.

Several propositions were passed without discussion until the matter of equalizing representation in the convention was reached. This had been broached in two resolutions, in one of which it was proposed that State and local organizations be required alike to pay dues of \$50 for each accredited delegate; the other limited the representation of State associations to two delegates, with dues of \$25 each.

At different times in the history of the association the pro rata contributions of State and local organizations have been changed and not both in the same proportions. This said Mr. Potts, had been protested against at various times, and it had been claimed that a State organization, because of its lower taxation, might get control of a convention were it desired. The national organization, he continued, needs the moral support of the State bodies, but one delegate from each with dues of \$25 a year seemed satisfactory to him.

Mr. Finneran thought that each State association should have three delegates so as to be represented on all convention committees in case no locals in the State were represented.

J. C. Wallace said that not now as in the early days did the N. A. R. D. need the financial support of the State associations; and he believed that the several State bodies should have equal limited representation. At the time of the Atlantic City convention he said that he, being presi-

dent of the Pennsylvania Pharmaceutical Association, was offered and declined an opportunity of seating another delegate on the payment of \$25. This financial basis for representation did not seem fair to him. The State associations were not strictly retailers' organizations, but should be affiliated for co-operation and each State should be on an equitable basis.

S. N. Jones thought that the only equitable basis for representation was a financial one. The N. A. R. D., he said, needs all the money it can get, and the small contributor should not have equal say with the one paying much more.

Mr. Meissner did not see where there would be any material decrease in the income of the association under the proposed limited representation; but he did believe that to have the representation on a financial basis made possible political manipulation. As the matter stands, he declared, local organizations are able to and do get representation cheaper by contributing through State associations. Mr. Mann believed that the limited representation plan was a happy solution of an oft-recurring problem, and would make little difference in the aggregate representation.

R. K. Smithers thought the plan illogical as representation should be on a basis of population. He did not think much of free moral support. His favor went to a plan with a numerical basis, as he believed that the non-retail members of State associations should contribute to the support of the national body. C. L. Hay was of the opinion that the smaller State organizations would be stauncher affiliates if they knew they had an equal voice with the larger ones. T. B. Cartmel, of Delaware, expressed the opinion that the present plan was best for the small States.

W. S. Elkin supported the proposed limited representation plan on the ground that it was modeled after the plan of the federal government, the representatives of the States being on a par with the senators, the delegates from the locals squaring with the members of the house. The question as he saw it was one of equal representation not of money. T. F. Cannon said that the Chicago delegates who were the sponsors of the equal tax plan were willing to accept the limited representation feature with equal taxation.

DATE OF MEETINGS.

Mr. Cannon was the first to discuss the proposed change in the time of holding the annual meetings, and favored an earlier date so as to take advantage of the business quiet incident to the vacation time and also to let the delegates be at home when the traveling men began their rounds and the school season was at hand. I. M. Light added that an earlier date would ensure vacation rates on the railroads. But Mr. Finneran thought that this would be offset by the difficulty of getting hotel accommodations.

Messrs. Wallace, Bodemann, Heinritz, and Bone offered reasons for a change to an earlier date.

PRICE PROTECTION.

Two plans were submitted as affording a legal and practicable means of preventing price cutting. One was a coupon rebate plan hailing from Illinois, the other a similar but coupon-less plan similar to several now in limited use. J. J. Boehm, of Illinois, the father of the first plan, advocated its approval as a necessity, a stable means of protecting retail prices and not in conflict with court decisions. He could see no obstacle to the adoption of the plan except the retailers, but these he believed would soon see the wisdom of accepting the plan, and then the sincerity of proprietors would be put to the test.

This plan was similar to one advocated eight or nine years ago and it proposed to make the N. A. R. D. a clearing house for coupons returned by retailers.

The matters of dispensing by physicians, the sale of liquors in "drug-store" saloons, and the refilling of prescriptions were considered rather briefly.

ENDORSEMENT OF DR. WILEY.

Relative to a resolution endorsing the efforts of Dr. H. W. Wiley, Mr. Hay said that, while all druggists were in sympathy with the endeavors of Dr. Wiley they should not too readily commend him because of his drastic opposition to all ready-made medicines. J. P. Crowley, of Illinois, said that Dr. Wiley had given druggists a great deal of trouble in the past year and had called them law-violators in published articles, hence he should not be unqualifiedly endorsed. Edward Williams, of Illinois, thought that the proposition to endorse Dr. Wiley was premature and presumptuous; and Mr. Cannon thought that to endorse the

Doctor personally while his actions were being investigated officially would be out of place.

W. E. Lee, of Pennsylvania, told the meeting that it could not go astray in endorsing Dr. Wiley; and another Pennsylvania delegate urged that the Doctor be given full credit for what he had done, the personal feelings of those who had felt his hand notwithstanding, as he stood for purity in drugs.

C. A. Storer, of Illinois, explained how the Chicago druggists had been put in a bad light in ice cream suits that had fallen through.

Mr. Anderson was opposed to taking sides in a political mix-up; and Mr. Finneran was for leaving the question to the federal officials. Mr. Bone wanted Dr. Wiley to get full credit; and Mr. Emanuel declared that the association could not afford not to endorse the Doctor. Mr. Meissner looked upon a failure to endorse Dr. Wiley as a calamity; and L. L. Walton called such a neglect a positive shame.

A baker's dozen other propositions were passed without discussion; and the meeting adjourned at 11:20 o'clock, having considered thirty-seven matters of policy.

SIXTH SITTING.

Thursday Forenoon.

It was 10:10 o'clock Thursday morning when the convention next assembled for regular business. The first matter taken up was the reading of the report of the auditing committee by Otto Groenland, of Ohio, chairman. This report showed that the financial records of the association had been audited by a regular auditing company at an expense of \$250, the committee believing that this method was the most satisfactory. Everything had been found in a gratifying condition. The report was duly adopted.

Several communications were read by the assistant secretary. And S. A. Eckstein, reporting finally for the committee on transportation, said that 178 return certificates had been satisfactorily passed upon by the validating representative of the railroads.

REPORT ON PHARMACY LAWS.

M. S. Kahn, of Maryland, chairman of the committee on pharmacy laws was not able to attend the convention, and the report of the committee was read by Assistant Secretary Rothwell. The committee stated that the legislative results of the past year were for the most part amendments to existing laws. These had been made in Florida, Illinois, Indiana, Michigan, Mississippi, New York, North Carolina, North Dakota, Ohio, Tennessee, and Vermont. A synopsis of the new laws was given.

The report also told of the activity of the Louisiana Board of Health in matters of drug quality, and the enforcement of the "shorter-hours" law in California.

It was suggested that the association's legal department aid in securing harmony among the State pharmacy laws, with a higher standard in pharmacy and better preliminary education. The members were urged to get able men on the boards of pharmacy; to restrict the practice of pharmacy in small towns by physicians; and the drug pedler was characterized as a worse evil than the dispensing physician.

The report was referred in the usual manner.

Reporting finally for the committee on the form of organization, T. S. Armstrong said that that body had no recommendation to make. This report was received.

Mr. Armstrong then reported finally for the committee on credentials, announcing that 223 delegates representing eighty-four organizations were entitled to votes in the convention.

To bridge a hiatus occurring at this time President Guilford called upon the representatives of the pharmaceutical press who responded with brief talks, in the following order: Mrs. Leslie O. Wallace, of the *Pharmaceutical Era*; Hugh Craig, of *THE DRUGGISTS CIRCULAR*; C. A. Mayo, of the *American Druggist*; E. D. Irvine, of the *Western Druggist*; John Helfman, of the *Bulletin of Pharmacy*; L. R. A. Suppan, of the *National Druggist*; and B. E. Pritchard, of the *Western Pennsylvania Retail Druggist*.

A. H. Beardsley, of the Miles Medical Company, was called to the platform, and expressed his gratification at the signs of the druggists' awakening to the folly of price cutting.

J. G. Bone read a letter from the general secretary of the Lord's Day Alliance of Canada; and the communication was duly received.

Secretary Potts voiced an appreciation of the aid ex-

tended by the exhibitors at the convention and they were formally thanked.

Chairman C. H. Huhn of the nominating committee reported as the unanimous choice of that body the names of the following nominees: For president, H. C. Shuptrine, of Georgia; for vice-presidents, T. B. Cartmell, of Delaware; E. A. Bernius, of Missouri; and S. A. Eckstein, of Wisconsin; for secretary, T. H. Potts, of the United States at large; for treasurer, H. I. Leith, of Rhode Island; for members of the executive committee, C. H. Huhn, of Minnesota; H. W. Merritt, of Pennsylvania; H. B. Guilford, of New York; J. A. Bean, of Massachusetts; E. H. Thiesing, of Ohio; and A. E. Zuber, of Illinois.

As a postscript to the report of the nominating committee, Mr. Huhn offered the following resolution:

Whereas, We learn with extreme regret that our esteemed co-laborer, Mr. Charles F. Mann, has decided to retire from the official family of the N. A. R. D.; and

Whereas, Mr. Mann has served this association as treasurer, president and chairman of the executive committee for so many years with such signal ability and faithfulness; therefore be it

Resolved, That with the passage of Mr. Charles F. Mann from the official life of the N. A. R. D. an irreparable loss has been sustained; and be it further

Resolved, That this association go on record as fully recognizing the great worth and appreciating the invaluable service of Mr. Mann to the N. A. R. D. and be it further

Resolved, That a copy of these resolutions be sent Mr. Mann as a slight token of our appreciation.

On motion the report of the nominating committee was received, the resolution included therein was adopted, and, the rules being suspended, the several nominees were elected by a ballot cast by the assistant secretary, the assemblage lead by Mr. Armstrong singing "So say we, all of us."

President-elect Shuptrine was introduced by Committeeman Merritt, who had been Rumor's candidate for the presidency, and voiced his gratitude for the elevation to office, promising to fulfil his duties as best hard work would make possible.

PROPAGANDIC WORK.

J. A. Bean, of Massachusetts, member of the propaganda committee, reported for that body in the absence of the chairman, J. G. Krul, of Kentucky. The report follows:

During the past year there have been ten letters sent to physicians, one each month, as during the previous year. These letters were printed on the first folio page of a pamphlet containing from eight to twelve pages. In each one of these pamphlets was also given an accurate description of three official preparations, including their pharmacological and therapeutic properties and characteristics.

The contents of these pamphlets have been published in Notes, practically in full, hence repetition here is unnecessary. The first issue of our journal, N. A. R. D. Notes, each month, prints the complete literature as it is sent to physicians as well as complete and reliable working formulas for the preparations to be exploited.

SATISFACTORY PROGRESS ESTABLISHED.

The report of the previous U. S. P. and N. F. propaganda committee made at Pittsburgh last year contained several valuable suggestions and recommendations regarding various factors affecting the propaganda work, and your present committee is pleased to note that some of these factors are receiving most extraordinary attention.

Among other things, protection to the pharmacist in his chosen art is to-day one of the burning questions in drugdom. The conference on legislation which our association has on the program at this convention undoubtedly marks the beginning of a better era for the pharmacist. The unjust and often illegal competition to which pharmacists are subject is a matter of great concern to our profession, and when part or all of this competition is removed, propaganda matters are bound to receive a decided impetus. We would therefore urge all of our members who have aught to do with legislative matters, to use every honorable method in their power to throw a mantle of protection around our chosen profession with the ultimate view of making our calling one for pharmacists only.

MEDICAL DISPENSING.

It is also noteworthy and important to give expression to the very excellent and praiseworthy motive that led to the approval of the following recommendation by the section on pharmacology and therapeutics of the American Medical Association at its 1911 meeting at Los Angeles, Cal.:

The proper selection, preservation, preparation, compounding and dispensing of medicine requires proper education and training not included in the courses of instruction given in medical schools, but comprised in the courses furnished by schools of pharmacy. Physicians are not trained to undertake the work of the pharmacists. However, as stated in the recommendation of the delegation, there are conditions existing which require physicians to dispense their own medicines. The section, therefore, recommends that physicians shall, as far as possible, relegate to pharmacists the dispensing and limit themselves to the prescribing of medicines; also that pharmacists place themselves in a position to act in co-operation with the medical profession by refraining from counter-prescribing, and recommend-

ing medicines for self-medication whether prepared by themselves or others.

Active propaganda work has now been carried on by this association for three years and we believe, to the best of our knowledge, that the progress made in this time is nothing short of marvelous. However, we realize that the work has only a fair start, and that results will continue to multiply as the years pass. The movement can be likened to an extensive advertising campaign, which in reality it is, and we must keep everlastingly at it.

SUMMARY AND SUGGESTIONS.

A careful summary has been made by the director of this department with a view of establishing the present status of this educational movement, a summary that is national in its scope and may truly be said to represent conditions as they are. The summary has been prepared from personal investigation and from conditions as they actually exist in the various cities and States.

First.—The number of U. S. P. and N. F. preparations called for in prescriptions has increased during the past two years. In some places the increase is not so pronounced, but in the majority of instances the average increase is from 25 to 50 per cent., surely a good showing. The observations in this respect establish the fact that the increase is in direct ratio as the amount of labor devoted to the work, thus emphasizing the fact that results only come by intelligent work and advertising.

Second.—Sampling the physicians, with the preparations as recommended each month by your committee, or with others, is very aggressively carried on in some localities, while in others this important work is somewhat or entirely neglected. It is significant to note in this connection that the greatest increase in U. S. P. and N. F. prescriptions is found in the localities where sampling is done regularly. It is strongly recommended, therefore, that ways and means should be adopted by local associations or individual members, looking toward a regular system of sampling physicians each month. Every local association can do it, and it is important, for it is one of the most convincing factors in the propaganda movement. "Get-together" meetings are also of incalculable value in developing a more harmonious feeling between members of the professions, and do much to render subsequent work more prolific and congenial.

Third.—The consensus of opinion among all pharmacists seems to be that the N. A. R. D. method of conducting the work with both physicians and pharmacists is the ideal method and deserves the support of every pharmacist. The greatest majority, however, are of the opinion that this work should be supplemented by work among the laity; that is, the druggist's customers. The method recommended is the distribution of such circulars, as the "Educating the Public" series, or such booklets as "About Prescriptions," "Things You Ought to Know," etc., all of which are published by the N. A. R. D.

This method gets right down to the real issue. It tells the public what's what in pharmacy; it educates them to use proper discrimination in the selection of a pharmacist or of a physician, and why this discrimination is necessary; it teaches the people the real difference in drugs and druggists, as well as the real difference in medical service and physicians.

This is the kind of work that really counts, for when the public knows what's what in pure drugs and medical service, then this same public may safely be allowed to select its own expert pharmacist and a good prescribing physician. This is not theory, but a method so intensely practical and full of common sense that it is slowly but surely revolutionizing the drug business in the hundreds of localities where it is adopted.

Such a method is strictly a foundational method, and well does it prepare the way for actual U. S. P. and N. F. propaganda work. In fact, it is creating a demand for official preparations and expert professional service, with the public at the creating end, the pharmacist and the physician merely meeting the public's demands. This naturally is the kind of knowledge that will enhance the value of propaganda work, and druggists generally are urged to adopt a similar method.

Fourth.—An attempt to locate the various handicaps to the ultimate and permanent success of the propaganda movement resulted in the discovery that five handicaps exist, and that the greatest of these was the pharmacist himself, for the simple reason that the pharmacist has the power to remove the other four if he so chooses.

The other handicaps are the unjust competition of the dispensing doctor caused largely by the activity of pharmaceutical and specialty manufacturing houses; the loose, indefinite laws that do not protect the pharmacist in his calling; the totally uncalled-for and criminal competition of the itinerant vender of medicines; and finally the apathy existing in many pharmaceutical and medical colleges.

However, it is apparent that the pharmacists can hope only through a powerful organization to accomplish these badly needed reforms. It resolves itself in the final analysis to this: Find out what we want and must have, and then fight for it to the bitter end.

This report was duly adopted; and the sitting was resolved into an open meeting of the propaganda committee. President Guilford relinquishing the gavel to Mr. Bean.

As a salutatory, Mr. Bean told what had been done in Boston during the past year to popularize official medications among the medical practitioners. The local druggists' organization had engaged a "detail man" who had made three calls on each of 500 physicians with an almost incredible increase in the prescribing of official preparations.

Another member recounted how the Ohio Valley Druggists' Association had spread the propaganda of non-secret medication among the physicians of Cincinnati and vicin-

ity. One of the features of this campaign was a "get-together" banquet.

From New York, Pennsylvania, the Middle West, New England and the South came testimonials of the efficacy of the propaganda in increasing the profits of the retail druggist. No member had a story of failure, and all were loud in praise of the work.

Mr. Bean turned over the chair to Vice-President Glad-ding, and at 1 o'clock the sitting adjourned.

SEVENTH SITTING.

Thursday Afternoon.

At 3:05 o'clock, President Guilford called the convention to order; and the report of the committee on finance was listened to. This was read by T. B. Cartmel, of Delaware, chairman. It embodied the acceptance of the report of the treasurer, and recommendations that the subscription price of *N. A. R. D. Notes* be \$2 a year, the dues of the association \$3 a year, and that at intervals copies of *Notes* be sent out to non-subscribers. It referred to a special committee the two resolutions having to do with an endeavor to equalize representation from affiliated bodies, and left the compilation of the annual budget to the executive committee.

The suggestions embraced in the report were considered seriatim. No discussion ensued in connection with any of the suggestions with the exception of that disposing of the resolutions on representation. Relative to this, J. C. Wallace raised a point of order, contending that any action tending to change the constitution or by-laws of the association was not in order unless brought up as an amendment to the constitution or by-laws.

W. C. Anderson argued that it was proper procedure to pass any resolution or recommendation and then amend the laws of the association so as to bring them in accord with the action. Mr. Cartmel took the same stand, but Mr. Wallace claimed his point of order and was sustained by the chair who ruled that the resolutions were in conflict with the constitution.

The offending paragraph was deleted from the committee's report; and the report was adopted.

Mr. Wallace offered an amendment to the constitution to limit the representation of State associations to two delegates at each annual convention, with dues for the first year of \$25 each, the dues to be fixed by the national association annually.

This matter went over until a later sitting.

The assistant secretary read a communication from a member at Phoenix, N. Y., who sought light as to why the metric system only was recognized in the Pharmacopœia, when it was not the official system of this country and very few druggists had metric weights and measures. The secretary was instructed to inform the member that the metric system is the official system of the federal government, and otherwise to enlighten him.

THE RESOLUTIONS.

W. C. Anderson, of New York, chairman of the committee on resolutions, presented the suggestions of the committee with regard to the policy of the association during the ensuing year. Several of these suggestions were subjected to minor changes as they were acted upon seriatim by the convention, those approved finally being worded as follows:

PRICE-PROTECTION.

Resolved, That price-protection shall continue to be one of the chief issues of this association.

Resolved, That we firmly believe in the effectiveness of a contract plan as a means of securing legal and beneficial price-protection.

Resolved, That we heartily commend the action of the Miles Medical Company in their loyal and unswerving support of the contract plan for price-protection and their true support of this association.

Resolved, That we commend the efforts of the Freeman Perfume Company and all other manufacturers who have supported and aided the cause of price-protection.

Resolved, That the new plans for price-protection proposed by the Lawrence County Retail Druggists' Association of Pennsylvania and the Chicago Retail Druggists' Association be referred to the executive committee with power.

ATTITUDE TOWARD CO-OPERATIVE CONCERNS.

Resolved, That our resolution adopted at the Pittsburgh meeting in 1910, endorsing all co-operative associations and organizations of retail druggists which benefit the retail druggist, is hereby reaffirmed.

Whereas, through the great influence and valued service of the National Association of Retail Druggists, its members have been brought into close relationship and effective organization,

one fruit of which has resulted in the establishment of a number of co-operative enterprises productive of substantial benefits to the retail drug trade; and

Whereas, the moral influence of the N. A. R. D. has been freely employed in the fostering of such enterprises and has commended their operations to the trade, the wisdom of its officers in such services rendered is hereby recognized and its policy commended; and

Whereas, the successful showing by many of these enterprises is causing a rapid growth of similar institutions in other fields, and the opportunity of the average retailer to ascertain their merit is meager, a well defined policy should be outlined whereby the national association should treat with all such concerns that the financial interests of its members may be most largely conserved; therefore be it

Resolved, That it should be the policy of the N. A. R. D. to advocate that in the management and control of enterprises built up and operated on the capital of druggists, financial control and business direction should be as far as possible in the hands of retail druggists, thereby securing greatest safety and permanence, and, there being a possibility that confidence in the N. A. R. D. would be impaired and its guidance questioned, in cases of financial loss through fraud or failure of such concerns, we deem it vital that the executive officers of the N. A. R. D. should be at all times in possession of all the facts obtainable concerning the financial condition and integrity of all institutions so operating; and

Resolved, That upon the request of the executive committee of the N. A. R. D. each co-operative druggists' concern shall be required to file some time during each year with the executive committee a detailed and certified statement of its financial condition which may be published in *Notes*, and that failure or refusal so to comply shall be regarded as sufficient grounds for denying the use of space in *Notes* for advertising by such concerns, or commendatory favor in the reading columns.

DR. WILEY AND PURE DRUGS LAWS.

Whereas, the National Association of Retail Druggists has been a pioneer in the movement in behalf of pure food and drugs, and has supported all wise and practical efforts to safeguard the food and drug supplies of the nation; be it

Resolved, That this association renews its deep interest in a hearty support of the principle of purity in foods and drugs as embodied in the federal food and drugs act, and the acts adopted in the various States, and pledges to Dr. Wiley and other government officers charged with the administration of these laws our co-operation and assistance to the end that the public welfare may be the further conserved and promoted; and

Resolved, That the thanks of this association are hereby extended to Dr. Wiley and his associates and State food and drug commissioners for every act of theirs which has given effect to the principles of pure food and drugs as declared and reiterated from year to year by this association.

Whereas, section 7 of regulation 7 of the food and drugs act permits the sale of U. S. P. and N. F. preparations of various strengths providing such strength is designated on the label; and

Whereas, such provision causes much confusion in the enforcement of pharmacy laws providing for the use of U. S. P. and N. F. names on drugs of standard strength alone; be it

Resolved, That the section should be repealed or so amended as to provide that all drugs sold to the public under their official names or recognized synonyms shall be of standard strength.

Resolved, That this association favors an amendment to the pure food and drugs act that will protect the public against unwarranted claims for nostrums and will provide that the manufacturing of medicinal preparations be in the hands of licensed pharmacists.

ANTI-NARCOTIC MOVEMENTS.

Resolved, That this association favors interstate anti-narcotic legislation that will prohibit all illegitimate traffic in narcotics and habit-forming drugs and confine their sales to proper channels, and uses to strictly medicinal purposes.

Resolved, That the National Association of Retail Druggists reaffirms its position as being opposed to the indiscriminate sale of habit-forming drugs.

FEDERAL DEPARTMENT OF HEALTH.

Resolved, That we favor a national department of health for the control, discharge and supervision of all national government activities which concern the public health, provided, First, that its establishment include a supervising board with proper representation from pharmacy to whom all questions contemplating changes from existing conditions, manner of regulation or control must be submitted and whose decision shall be final in governing the administration of said department; secondly, that its various sub-departments include one especially devoted to pharmacy and drugs, and another to chemistry, each to be in charge of a specially qualified person.

Resolved, That the executive committee be instructed to request representation for pharmacy at conferences that are held to consider the provisions under which a national department of health shall be established.

REFILLING OF PRESCRIPTIONS.

Whereas, there is little if any legislation prohibiting the refilling of physicians' prescriptions, we believe the physician should specify "do not refill" in English words on each and every prescription which he desires not to be refilled;

Whereas, the members of the National Association of Retail Druggists desire the co-operation of all physicians in protecting and preserving the public health; therefore be it

Resolved, That no prescription upon which the words "do not refill" written in English words appear shall be refilled without the order of the physician; and

Resolved, That no person shall be furnished a copy of any such prescription.

TELEPHONES.

Resolved, That the executive committee be instructed to utilize the services of at least one organizer for special work in the interest of better conditions for the retail drug trade with reference to telephone service and commissions.

Resolved, That the organizer thus selected pursue an active propaganda under the supervision of the telephone committee, and visit such cities as give promise of installing the slot phone and such other places as may have telephone troubles that may be adjusted by him in the interest of our members.

Resolved, That in the financing of this proposition the burden of expense to this association be lightened by the telephone company's assuming its proper proportion.

Resolved, That in view of the many complications and conditions arising out of the slot-telephone problem which so vitally affect the interests of our members, every effort be put forth to retain such advantages as we have gained and to continue most harmonious and beneficial relations; and

Resolved, That our representative confer with the officials of the telephone company with the view of preventing encroachment upon the present basis of compensation.

NEWSPAPER SENSATIONALISM.

Whereas, many people commit suicide or homicide through the use of poisons, and official attention having been drawn to this, legislation for the restriction of their sales is proposed directed especially against branches of the drug trade; and

Whereas, most poisonous substances so employed are either disinfectants or chemicals used in the arts and sold in other lines of business where it would be impossible to comply with methods of sale affording effective control of such articles; and

Whereas, the real trouble is the fact that the name of the poison, and as far as possible the dose employed, as well as fairly accurate information as to the proper dose to employ are usually printed in the newspapers, inducing morbid people and criminals to use these poisons through reading such statements; therefore be it

Resolved, That the members of the N. A. R. D. and its more than one thousand affiliated branches urge upon the coroners and other officials of their States, and especially upon the proprietors of all newspapers published within the State, the importance of refraining from furnishing to the public the name of the poison used in any case of suicide or homicide by poison, and especially from giving instructions regarding the methods of using such poisons and the amount constituting a fatal dose.

PUBLIC RELATIONS.

Whereas, the public has shown a commendable interest in matters relating to food and drugs and is seeking information from reliable sources; and

Whereas, the medical societies have taken an active part in the public work relating to health and sanitation, and in the absence of proper pharmaceutical representation in these movements have attempted to deal with questions of drugs and medicines as they relate to the public weal; therefore be it

Resolved, That the National Association of Retail Druggists shall hereafter take a prominent part in its own behalf in all public work which has for its object the protection of the public health and morals when the same involves in any manner the manufacture, distribution and sale of drugs, medicines, medicinal preparations and appliances; and be it further

Resolved, That to this end a public relations committee of the national association be created, to be appointed annually by the president, the said committee, to consist of five members and constitute one of the standing committees of the association, and to include as ex-officio members the members of our committee on advertising and the editor of our official organ, N. A. R. D. Notes.

GENERAL AND SPECIFIC NATIONAL LEGISLATION.

Resolved, That we favor a meeting of representatives from all branches of the drug trade with a view of giving proper consideration to proposed national legislation which affects pharmacy and the manufacture and sale of drugs, to the end that a proper understanding may be arrived at as to the need and scope of such legislation, as well as the manner of protecting the interest of pharmacy and the common welfare thereto; and

Resolved, That the National Association of Retail Druggists request and advocate such joint meetings and will take an active part therein.

Resolved, That all parcels-post bills continue to receive the vigorous opposition of the retail drug trade.

Resolved, That we favor an amendment to the Sherman anti-trust law, or the enactment of a new law, the provisions of which will not interfere with the welfare of the small merchant who seeks protection and not destruction from large monopolies.

Resolved, That the patent laws be amended in accordance with the well established views of the association as outlined in its conventions for several years past.

Resolved, That the bill to place a tax on proprietary medicines be vigorously opposed.

GOVERNMENT PHARMACISTS.

Resolved, That we petition the president of the United States to request congress to take such action as will elevate the pharmacist in the different government positions which he may occupy.

LABELING WOOD SPIRIT.

Resolved, That we reaffirm the position taken by this association at its last meeting with reference to wood alcohol, and that we continue our efforts to have the name "wood alcohol" changed to "wood naphtha"; and

Resolved, That a copy of this resolution be sent to the

revision committee of the United States Pharmacopoeia, with the request that they give it their serious consideration.

DATE OF ANNUAL MEETING.

Whereas, the holding of the annual convention of this association at so late a date is not only a handicap for many retailers who attend, but also militates against the attendance of many who otherwise might do so; be it

Resolved, That the executive committee be requested to give this matter serious consideration, and if possible arrange an earlier date for our next annual convention, preferably in the month of August.

TENTH ANNIVERSARY OF NOTES.

Resolved, That this association favors the issuing of an extraordinary edition of N. A. R. D. Notes to celebrate the tenth anniversary of that publication, the date of issue of which shall be left to the executive committee, and a copy of which shall be mailed to every retail druggist in the United States.

PROCTER MEMORIAL FUND.

Resolved, That the National Association of Retail Druggists appropriate from the funds of the association the sum of one hundred dollars for the Procter memorial fund.

PROMINENT ISSUES.

Resolved, That price-protection, propaganda work and legislation continue to be prominent issues of this association.

FRATERNAL RELATIONS.

Resolved, That the resolutions presented by the National Association of Pharmacologists providing for a working committee of members of the National Association of Retail Druggists and the National Association of Pharmacologists to be appointed, be referred to the committee on fraternal relations.

SUNDAY REST.

Resolved, That this association respectfully recommends that all retail druggists will as far as practicable observe Sunday, or such portion thereof as possible, as a period of rest.

PERSONAL POLITICAL ACTIVITY.

Resolved, That we urge upon our members the necessity of taking an active interest in political affairs and of having representation in our legislative halls.

SALE OF LIQUORS.

Resolved, That we reaffirm our oft-repeated declaration that we are opposed to the sale, in retail drug stores, of intoxicating liquors for other than medicinal purposes.

DEPARTMENTS AND COMMITTEES.

Whereas, the service rendered by the N. A. R. D. committee on U. S. P. and N. F. propaganda during the past year has been of recognized scope and efficiency, and its possibility for increased usefulness unlimited; be it

Resolved, That this committee be continued, and its efforts to accomplish results be encouraged by placing at its disposal sufficient funds to enable it to perform all service duly assigned by it.

Resolved, That the legal department of the N. A. R. D. be continued under the direction of the executive committee; and

Resolved, That the services of our attorney be given to the legislative committee at such times and in such capacities as that committee may desire.

Resolved, That the executive committee shall be instructed to enlarge the number of the active field organizers not to exceed ten, as the needs of the association may in their judgment require.

Resolved, That the committee on national legislation be appointed as soon as possible after each year's convention.

Whereas, the system employed during the past year for supervising advertisements accepted by our official organ, Notes, has given general satisfaction; be it

Resolved, That a similar committee be appointed to perform the same duties during the coming year.

Whereas, the collection department has rendered valuable service to this organization, be it

Resolved, That this department be continued.

APPRECIATION AND COMMENDATION.

By resolution the convention voiced its appreciation and commendation of its officers and employees, the Women's Organization of the National Association of Retail Druggists, the local entertainment committee, the hotel management, the exhibitors, and the pharmaceutical press.

Very few of the forty-eight affirmative recommendations made by the committee were discussed. One of these few was that having to do with the price-protection plans submitted to the convention. As originally reported by the committee the suggestion was that the plans be investigated by the executive committee and reported upon at next year's meeting. This was characterized as unnecessary and harmful delay by J. J. Boehm, who declared that the retail drug trade needed price-protection right now and could get it if the national association would but offer a plan to proprietors. He moved that the suggestion be amended so as to secure immediate action by the committee. This motion was supported by Messrs. Crowley, Wells and Wallace; and the recommendation was amended to read as in the report above.

Another recommendation getting considerable attention was that relating to the refilling of prescriptions. It was the general consensus that druggists should not be expected to respect the phrase "do not refill" unless it was

plainly indicated by the physician that it was his intention that the prescription was to be filled but once. It transpired that printers of prescription blanks quite generally put a not-to-be-refilled legend on all blanks which is often overlooked by the prescriber. Mr. Anderson pointed out that the chief obstacle to better relations between physicians and druggists was the belief on the part of the former that druggists refilled prescriptions too indiscriminately. The physician, he said, has the right to control his prescriptions; and for the druggists to tell the doctors that their prescriptions would be refilled as the druggists saw fit would be to drive the doctors to dispensing.

Messrs. Fluck, Shuptrine, Holthoeffer, and Elkin thought that the recommendation gave too much power to the physician. They favored the purpose of the recommendation but urged that the phraseology be such as to require a direct order from the prescriber and not let printed directions suffice. J. F. Finneran was opposed to giving the medical societies any opportunity to secure legislation against refilling. Mr. Potts thought that the physician had no right to restrict the refilling of any but narcotic-containing prescriptions or those calling for poisons.

The recommendation was finally amended to require a written direction by the prescriber.

The following resolution approved by the committee was tabled by the convention.

Resolved, That it is the sense of this association that boards of pharmacy should exercise their power to refuse, suspend or revoke any license for the ownership of a drug store when it is found that such alleged drug store is being used as what is commonly known as "blind tigers" for the unlawful sale of spirituous liquors.

When this resolution was reported by the committee L. L. Walton, of Pennsylvania, suggested that it be amended to require conviction at law as proof of guilt. J. F. Guerin, of Massachusetts, was of the same opinion; but R. K. Smithers, of New York, favored the committee's phraseology.

C. H. Huhn, of Minnesota, could see no necessity for the proposed step which he thought would cast a reflection upon the drug trade. So, too, thought J. J. Bohme, of Illinois; while B. E. Pritchard, of Pennsylvania, favored the resolution as a frowning by the association upon a blame-worthy practice.

The committee's report recommended the disapproval of the following propositions:

One providing that the legislative committee be instructed to have the federal license act amended so as to permit the sale of alcohol for medicinal use without the seller being obliged to pay the regular retail liquor dealer's license of \$25 annually.

One providing that N. A. R. D. Notes refuse advertising matter from firms that do not restrict their wholesale prices to a specified amount.

One providing that we request a druggist to become the judge as to whether physicians' prescriptions should be repeated or not by refusing to refill prescriptions containing certain drugs.

One providing for the appointment of a committee for the purpose of criticising the advertising matter of manufacturers, and to use efforts to have laws passed prohibiting the use of such advertising matter.

One providing that the executive committee shall take up on behalf of different organizations supposed infringements of the Sherman anti-trust law.

One providing for an attempt to have a combination license for retail druggists covering the sale of spirituous liquors and habit-forming drugs.

One providing that manufacturers shall be compelled to place upon the labels of their products the proportion of bromine, nux vomica, hyoscyamus, arsenic, iodine and many other drugs which such preparations contain.

One providing that this association shall take active steps in reference to designating what condition shall prevail as to the statements placed upon the labels for various preparations concerning their therapeutic properties.

One providing that our members offer their stores as distributing depots for contemplated health journals for distribution to the laity.

One providing for legislation to regulate the dispensing, sale and application of drugs by physicians.

Not all these recommendations were concurred in without argument. H. G. Sandkoetter, of Illinois, opposed the first one, that relating to seeking to amend the internal revenue law, because he considered the present law unjust as it affects druggists. The proposition was put to a vote, and the committee was sustained by a vote of 65 to 20.

Opposition next arose to the last recommendation, that having reference to dispensing by physicians. Mr. Pritchard wished to know why the committee was opposed to the resolution. Mr. Anderson explained that to pass it would be folly, that pharmacists had enough to do in cleaning up their own house, and that the more they meddled in medical affairs the more opposition would be offered by physicians.

Mr. Shuptrine considered the resolution useless and Mr. Holthoeffer called it hypocritical.

A motion to overrule the committee was lost; a motion to amend the committee's finding was tabled; and the action of the committee was concurred in.

The report of the committee on resolutions was then adopted as a whole in its revised form.

W. S. Elkin offered an amendment to the constitution providing for the election of but two members of the executive committee each year, the members to serve for three years.

This matter went over to a later sitting.

W. C. Anderson moved that the constitution and by-laws be amended so as to provide for the committee on public relations authorized by a resolution previously adopted.

This also went over to a later sitting, the convention adjourning for five minutes so as to provide an extra session.

EIGHTH SITTING.

Thursday Afternoon.

When the meeting was again called to order, Mr. Anderson secured the adoption of the amendment offered by himself at the preceding sitting.

Messrs. Walton and Elkin called up the amendments they had respectively offered at the preceding sitting, but as an objection was stated in each case, and a unanimous vote being necessary for ratification, both propositions were laid over until the 1912 meeting.

Mr. Elkin at this time addressed C. F. Mann, of Detroit, Mich., who had declined to serve longer on the executive committee, commending him for his labors in behalf of the organization and presenting to him a token of the esteem in which he was held by the members of the association; which token, Mr. Elkin had to regret, had not then assumed a tangible form but was forthcoming.

Mr. Mann, in responding, expressed his gratification for the heritage of friends his official life had left him.

On behalf of the representatives of the pharmacal press C. A. Mayo, of New York, presented a resolution of thanks to Secretary T. H. Potts, who, replying, said that he recognized the assistance of the pharmacal press as most valuable.

Messrs. Elkin and Mann acting as ushers, the newly elected officers were duly installed. The assemblage, perhaps the largest ever present at a closing sitting, sang one stanza of "America." And at 6:35 o'clock President H. C. Shuptrine declared the thirteenth annual convention adjourned.

The Entertainments.

Just as long as "the wind bloweth where it listeth" Niagara Falls and the milk-white waters of the gorge will continue to hold out new and ever-changing aspects that tire not the spectator, be he never so frequent a visitor: each shifting of the wind, even each turn of a zephyr, sets anew the curtain of mist and spray, revealing, concealing the wonders—but it takes a Shuptrine to describe Niagara. Sufficient is it to say that none there was among the hundreds whom the convention had brought together, first visitor and he of a hundred trips, who did not stand in wonder and gaze with awe at the world's gorgeous spectacle. Add to the unequalled natural attractions of the place, the spirit of hospitality and good cheer and the means of relaxation and enjoyment afforded by the entertainment committee, and there need be no wondering at the social success of the meeting.

Not on the official program but nevertheless tremendously enjoyed by the visitors was the address by Elbert Hubbard on Monday afternoon. The Fra handed out some pertinent advice along with his peculiar, piffous philosophy. Advice that seemingly was heeded, for there were numerous indications that the delegates had in mind his Rule 5.

Foremost among the formal entertainment features was the president's reception and dance on Tuesday evening. One regret there was: The reception hall at the Cataract House was just half large enough.

On Wednesday an inspective tour of the shredded wheat plant occupied the ladies; and there was an informal reception for them in the evening.

Tuesday afternoon the ladies viewed the falls from the many points of observation, being driven about in carriages.

Last and perhaps most impressive was the gorge-line trolley trip on Friday morning, which was made by several hundred visitors.

Because of inclement weather the open-air vaudeville and smoker scheduled for Thursday evening was held in the hotel dining room.

The thrilling trip on the "Maid of the Mist" was provided for the ladies on Thursday.

As It Were—

Honest Injun, now; just what ratio does the amount of real work done bear to the amount of time variously wasted? The actual time that the convention proper was in session was sixteen and one-half hours, with three and one-fourth hours additional consumed in the open meeting of the committee on resolutions.

That recurrence of the newspaper-reporter-stuffing so disconcerting at the Atlantic City meeting three years ago, incited several remarks of "Officer, he's in again." Goodness me! cannot this undesirable publicity be prevented?

"Standing theh, Misteh Mayah, suh, and gazing, as it weh, upon the very haht-pulses of Natchuh"—yes; that's Shuptrine. He's a druggist, yes; hasn't time to go to congress.

There could scarcely be a possibility of any one fighting more valorously in the face of sure defeat than do the two W's from Pennsylvania—might except "Tom" Armstrong.

"Told you so;" meaning that we have several times remarked upon the manner in which H. B. Guilford can put the Indian sign on guff. Some alacrity there!

In the matter of getting things the druggists could profit much by observing their better-halves among the exhibits—or the man who ordered the perfumes.

J. Arthur Bean wants to know, every time he comes to a convention—well, he's found out, hasn't he?

Then, too, some of the smaller commonwealths have the know-how of the getting-things game down pat.

For N. A. R. D. anthem: "Die Schnitzelbank," without opposition.

Merritt or merit, it's all the same.

New Officers of W. O. N. A. R. D.

At the annual meeting of the Women's Organization of the National Association of Retail Druggists held at Niagara Falls, contemporaneously with the convention of the N. A. R. D., the following officers were chosen for the ensuing year:

President, Mrs. C. A. Storer, of Chicago, Ill.; vice-presidents, Mrs. J. G. Godding, of Boston, Mass.; Mrs. Louis Emanuel, of Pittsburgh, Pa.; Mrs. J. H. Fricke, of St. Louis, Mo.; Mrs. J. O. Bosley, of Wilmington, Del.; and Mrs. R. G. Rutherford, of Brooklyn, N. Y.; secretary, Mrs. W. E. Lee, of Philadelphia, Pa.; treasurer, Mrs. O. C. Groenland, of Cincinnati, Ohio; members of the board of directors, Mesdames L. O. Wallace, of Canton, N. Y.; W. S. Richardson, of Washington, D. C.; R. E. Dorland, of Decatur, Ill.; J. J. Sieberz, of Louisville, Ky.; J. T. Roe, of Mobile, Ala.; F. E. McBride, of Youngstown, Ohio; A. J. Riess, of Rockland, Ill.; and H. C. Shuptrine, of Savannah, Ga.

National Association of Pharmacologists.

The executive board of the National Association of Pharmacologists met at Columbus, August 29th.

Resolutions were passed deprecating the operation of drug departments in State institutions by unregistered men and appealing to the governors to see that the pharmacy laws are fully complied with.

The pure food and drug laws, federal and State, were strongly endorsed.

It is the plan of the committee on arrangements for the 1912 meeting of the Pennsylvania Pharmaceutical Association, which will be held at Buena Vista Springs, to have several joint meetings with the Maryland Pharmaceutical Association which will meet just across the border at Blue Mountain House at the same time. The meeting date is June 25th to 27th.

South Dakota Association.

The annual meeting of the South Dakota Pharmaceutical Association was held at Huron, August 23d to 25th.

At the opening session, presided over by President Krebs, the members were welcomed by Local Secretary Perriton and Mrs. Perriton; short addresses were made by several members and the president delivered his annual address.

A number of papers on various interesting topics were presented.

There were no contests among the members for the various offices, all being elected by acclamation, as given below:

President, J. F. Wagner, of Garden City; first vice-president, H. C. McClain, of Tripp; second vice-president, George Sherman, of Canton; treasurer, A. A. Woodward, of Aberdeen; secretary, E. C. Bent, of Dell Rapids; local secretary, L. E. Highley, of Hot Springs.

Two of these officers, E. C. Bent and A. A. Woodward, succeeded themselves.

The following named persons were nominated by the association to the governor as candidates from which to select a member of the board of pharmacy to succeed G. F. Swartz, of Redfield; F. D. Kriebs, of Beresford; and C. B. Baldwin, of Rapid City.

As indicated above, Hot Springs was chosen as the place for the next meeting.

Nearly three hundred persons were in attendance at the meeting.

Picnics.

Being old acquaintances with water in more ways than one the druggists of Portland, Me., and vicinity, constituting the Cumberland County Druggists' Association went right on with their picnic held August 31st, despite the rain. The downpour however made sliding to bases so easy and throwing curves so hard that the ball game lasted but two innings. A prize whist tournament was the exciting indoor sport.

Base-ball seems to be the natural outcome of pill-rolling—of course in the winter bowling is recognized as a close relation—and there was some ball playing when the Holyoke, Mass., druggists crossed bats with their doctor neighbors at the joint annual clam-bake August 23d. Both sides claimed the victory when the game was called because the clams were cooked.

The annual outing, field meet, and ladies' day of the Alumni Association of the Rhode Island College of Pharmacy and Allied Sciences occurred August 31st, at Bay Shore, near Providence. Even though it rained everybody had a good time.

That rainy last day of August seems to have been especially moistened for druggists' outings. Another picnic party to brave the wet on that day was the Troy (N. Y.) Pharmaceutical Association at its tenth annual outing. The so-called base-ball game was declared a tie when John Healey lost the ball. Everybody scored equally in the clam-bake.

Druggists cannot always beat the drummers at base-ball; see that 12 to 10 score at the first annual clam-bake of the Utica, N. Y., druggists, September 4th.

The New Orleans (La.) Drug Clerks' Social Club had an evening-at-home August 29th, and a big-time outing at Mandeville, September 17th.

Anti-Narcotic Doings.

B. E. Laughlin, of San Jose, Cal., plead guilty, August 21st, to a charge of illegal morphine selling, and was sentenced to pay a fine of \$100.

A man and woman were arrested in Brooklyn, N. Y., September 9th, on the charge of maintaining a cocaine dispensary. A large quantity of the drug was found in their quarters.

The grand jury of Hinds county, Mississippi, in its September communication reported as follows:

The sale and use of cocaine is alarming, principally among the negroes, who in some sections of the county, when short of cash, have actually bartered their farm products for the drug. We trust good citizens will continue to assist the officers in rooting out this evil, which is demoralizing labor and filling the jails with criminals.

A layman and a druggist of Newark, N. J., were recently apprehended by the police charged with conniving in the illegal sale of chloral. It is alleged that the druggist had filled a prescription for the drug, forged by the other defendant.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

- ALABAMA—October 10th, at Montgomery. E. P. Galt, Selma.
- ARIZONA—November 8th, at Phoenix. A. G. Hulett, Phoenix.
- ARKANSAS—J. F. Dowdy, Little Rock.
- CALIFORNIA—December 5th, at Hartford. J. A. Levery, Bridgeport.
- COLORADO—S. L. Bresler, Denver.
- DELAWARE—N. C. Downs, Wilmington.
- DISTRICT OF COLUMBIA—October 12th and 13th, at Washington. S. L. Hilton, Washington.
- FLORIDA—January 16th and 17th, at Jacksonville. D. M. Ramsaur, Palatka.
- GEORGIA—C. D. Jordan, Monticello.
- IDAHO—J. M. Starrh, Shoshone.
- ILLINOIS—F. C. Dodds, Springfield.
- INDIANA—October 11th and 12th, at Indianapolis. W. H. Fogas, Mt. Vernon.
- IOWA—December 5th, at Des Moines. E. J. Moore, Des Moines.
- KANSAS—November 15th, at Hays. W. E. Sherriff, Ellsworth.
- KENTUCKY—October 10th and 11th, at Mt. Sterling. J. W. Gayle, Frankfort.
- LOUISIANA—F. E. Earhart, New Orleans.
- MAINE—October 11th and 12th, at Augusta. F. W. Bucknam, Skowhegan.
- MARYLAND—Ephraim Bacon, Roland Park.
- MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
- MICHIGAN—J. J. Campbell, Pigeon.
- MINNESOTA—October 16th, at Minneapolis. C. T. Heller, St. Paul.
- MISSISSIPPI—L. H. Wilkinson, Greenwood.
- MISSOURI—October 9th, at St. Louis. C. E. Zinn, Kansas City.
- MONTANA—October 11th, at Great Falls. S. J. Coffee, Missoula.
- NEBRASKA—A. V. Pease, Fairbury.
- NEVADA—November 1st, at Reno. R. L. Prouty, Tonopah.
- NEW HAMPSHIRE—F. H. Wingate, Nashua.
- NEW JERSEY—October 19th and 20th, at Trenton. H. A. Jorden, Bridgeton.
- NEW MEXICO—A. J. Fisher, Santa Fe.
- NEW YORK—W. L. Bradt, Albany.
- NORTH CAROLINA—December 5th, at Raleigh. F. W. Hancock, Oxford.
- NORTH DAKOTA—October 16th, at Fargo. W. S. Parker, Lisbon.
- OHIO—F. H. Frost, Columbus.
- OKLAHOMA—J. C. Burton, Stroud.
- OREGON—F. C. Pozzi, Portland.
- PENNSYLVANIA—November 10th and 11th, at Philadelphia and Pittsburgh. L. L. Walton, Williamsport.
- RHODE ISLAND—November 7th, at Providence. J. E. Brennan, Pawtucket.
- SOUTH CAROLINA—November 15th, at Abbeville. F. M. Smith, Charleston.
- SOUTH DAKOTA—October 11th and 12th, at Aberdeen. E. C. Bent, Dell Rapids.
- TENNESSEE—October 17th, at Knoxville. I. B. Clark, Nashville.
- TEXAS—R. H. Walker, Gonzales.
- UTAH—October 17th and 18th, at Salt Lake. W. H. Dayton, Salt Lake.
- VERMONT—D. F. Davis, Barre.
- VIRGINIA—October 24th, at Richmond. T. A. Miller, Richmond.
- WASHINGTON—P. Jensen, Tacoma.
- WEST VIRGINIA—A. Walker, Sutton.
- WISCONSIN—Edward Williams, Madison.
- WYOMING—C. B. Gunnell, Evanston.

Kansas Board.

At a meeting of the Kansas Board of Pharmacy held at Winfield, August 23d, 47 candidates for registration were examined. Of these 18 were passed. Their names follow:

O. J. Bellwood, of Turon; John T. Blank, of Elk City; Lota Bunch, of Beloit; M. W. Darst, of Caldwell; W. H. Firth, of Emporia; H. E. Fowler, of Independence; P. H. Lindley, of Havana; J. O. Little, of Mulvane; R. E. Mitchell, of Caney; L. C. Mosier, of Liberal; Clarence Newton, of Alta Vista; E. E. Nyman, of Lawrence; W. F. Peel, of Pratt; A. J. Porter, of Abilene; R. E. Rathbun, of Sedan; C. L. Smith, of Abilene; Leo E. Waller, of Hutchinson; and W. F. Woodford, of Topeka.

The next meeting of the board for examination will be held at Hays, November 15th.

Maine Board.

At a meeting of the Maine Board of Pharmacy held at Augusta August 9th and 10th, 19 candidates for registration were examined of whom the following were passed:

As pharmacists—James H. Allen, of Waterville; Wallace L. Barney, of Milo; Linwood C. Bubier, of Lewiston; Guy R. Harriman, of Norway; William H. McGrath, of Biddeford; Carl E. Stone, of Norway; and William H. Ward, of Lewiston.

As assistant—Robert N. Miller, of Caribou.

Pennsylvania Board.

At a meeting of the Pennsylvania Board of Pharmacy held at Williamsport, August 24th and 25th, there were 20 applicants for registration as pharmacist, and 33 as assistant. The following were passed:

As pharmacists—Joseph L. Capozio, of Philadelphia; James H. Ennis, Jr., of Jenkintown; Stuart L. Kleckner, of Mifflinburg; and Howard G. Schauermaun, of Philadelphia.

As assistants—Thomas H. Aughinbaugh, of Clearfield; Abraham Gruber, of Philadelphia; John E. Hamilton, of Smithton; James H. Hodgkins, of Williamsport; William C. Marshall, of Altoona; Gustaf L. Noestert, of Mt. Carmel; Arthur J. Smith, of Dushore; Harvey E. Stouffer, of Reading; and Hyman Yaskin, of Philadelphia.

Nearly all of the applicants for registration as pharmacists were persons who failed in the June examination.

The board decided to undertake the prosecution of all persons who violate the new poison law.

Resolutions endorsing Dr. Wiley were adopted, reciting that the board had learned to appreciate his scientific ability, integrity and devotion to duty, and that it believed his removal from the office "would be a great loss to the American people and a direct blow to the integrity of a conscientious, faithful and efficient public servant."

The next meeting for examination will be held at Philadelphia and Pittsburgh, November 10th and 11th.

Tennessee Board.

At a meeting of the Tennessee Board of Pharmacy held at Nashville in July, 39 candidates for registration were examined, of whom the 13 named below were passed:

W. H. Allison, of Nashville; W. H. Blakely, of Old Fort, N. C.; R. R. Bost, of Nashville; M. W. Braden, of Lynnville; S. S. Bradshaw, of Nashville; J. H. Castleman, of Nashville; P. F. Johnson, of Knoxville; Leslie Lide, of Nashville; R. S. Mills, Jr., of Nashville; Basil Moses, of Big Sandy; G. W. Reed, of Nashville; Elizabeth C. Reynolds, of Nashville; and H. A. Shannon, of Springfield.

The board adopted the following rules:

"All applicants for examination must have preliminary qualification equal to a grammar school education and file with application for examination, his diploma from a grammar school, or a certificate from county superintendent of schools, as evidence of the required educational qualifications.

"To meet especial emergency cases the board will issue a temporary certificate, good only from date of issuance until the next meeting of the board; issued only to applicants who are qualified to receive permanent license and are engaged in the practice of pharmacy under the direct supervision of a registered pharmacist. In no instance will a temporary certificate be extended beyond the date of expiration. The fee for issuing a temporary certificate is \$10 in addition to the regular examination fee."

The next meeting of the board will be held at Knoxville, October 17th.

Der New Yorker Deutsche Apotheker-Verein.

BY DR. WILLIAM C. ALPERS.

The organization of the Deutsche Apotheker Verein, sixty years ago, may be called one of the most important events in the history of American pharmacy. The Verein is not only the oldest pharmaceutical association in this country, not counting colleges, antedating even the venerable American Pharmaceutical Association by one year, but it has proved to be an association of great energy and great influence. More than once it has given the impetus to some movement for pharmaceutical improvement, and pharmaceutical ideals have gone forth from its headquarters to every part of the United States. There has been no general movement in pharmaceutical matters during the past six decades in which this German association did not take an active part, and it is no exaggeration to say that its influence is felt to-day more powerfully than that of any like association, with the exception, perhaps, of the American Pharmaceutical Association. It has embraced in its work every branch of pharmaceutical activity; it has made for higher education; it has advocated the founding of colleges; it has been prominent in furthering the passage of beneficial pharmaceutical laws; it has entered into the fight against substitution; it has helped whenever possible to bring about a freer and more friendly intercourse between the members of the profession.

The great desire for political freedom, the spirit of republicanism that shook Germany in the year 1848 had passed. The revolution that tried to bring about a united Germany was a revolution principally of the educated classes, and when afterwards the reaction

set in, thousands and thousands of young men who were filled with the spirit of political and social freedom left their homes and scattered to all parts of the world. Some went by compulsion because they were exiled from their own country, others left in the following ten years because they could not, or would not, become accommodated to the restraint that the political reaction imposed upon them.

The whole world profited by this revolution, for German energy, German education, German idealism, went everywhere, but the country that profited most was the United States of America. For to this country, the home of the brave and the free, the larger portion of these exiles turned in expectation of finding a place where the ideals of their youth would be realized. It was thus that men like Carl Schurz, Abraham Jacobi, and Hans Kudlich came to these shores, and this country received the benefit of their master minds. It was in these years also that many educated

pharmacists left Germany and settled in New York and other cities of the United States. No wonder that they flocked together! The assimilation of foreign spirit, foreign energy, foreign culture by Americans was not as easy then as it has since become. These newcomers represented their own country to the fullest extent in every way, and it was therefore more difficult for them to accommodate themselves quickly to new surroundings, but they came with the intention of becoming permanent citizens of the United States. Their conception of citizenship was an ideal one, and they were willing not only to reap the benefits that their new home might give them, but also to do honest work and assume all the responsibilities that the new country might put on them. They were true Americans in spirit the very day they set foot upon these shores,

because they were free men, free in hope and in desire, and they remained true to their ideals to the end of their lives.

Such was the mental caliber of the founders of the Deutsche Apotheker Verein. They saw with sadness the deplorable condition of pharmacy at that time in this country. The apothecaries of Germany were highly respected, the equal of other professional men, in their own home, so they set about to do something to make their condition better in this city. They formed a society, laid out work, and went about it with a will. They have been at it now for sixty years, and have accomplished much. It is one of the most satisfying facts in the history of American pharmacy that the men who now are the leaders of the Deutsche Apotheker Verein are aware of the great and important inheritance that is left to them, and strive to turn it over to a later generation in its old brilliancy.

At a meeting held September

30th, 1851, which extended to the early morning of October 1st, the founding of the German society was accomplished, its name being Neu Yorker Pharmaceutische Lese-Verein (New York Pharmaceutical Literary Society). There were twenty-five German apothecaries present, namely:

H. M. Brandis, G. A. Cassabeer, Wilhelm Ehlers, Albrecht G. Dung, H. Gnadendorf, W. Gottschalk, Ludwig H. Hasse, Gottfried Heberling, Jacobsen, J. Jansen, Charles T. Mayer, Fr. Mayer, Ferdinand Mann, Hermann Metz, Heinrich Mollwitz, Adolph Nietsch, Gustav Ramsperger, John Rudolph, Gustav Schaffer, C. Seidel, T. Schmidt, H. Walldorf, Philip Wiskemann, and Zimmermann.

The first president of this society was G. A. Cassabeer. The immediate object of this new association was the securing and reading of scientific and secular literature. The various journals and magazines were circulated from house

to house. The society, however, soon extended its scope of activity, and the name Deutscher Pharmaceutischer Verein (German Pharmaceutical Association) was adopted. In the year 1864 the name was again changed, this time being made Deutsche Apotheker Verein (German Apothecary Association) and the society is generally known by this name to-day. The official name, however, is different. It happened that in the year 1864 a second German association was formed under the name Scientific Society of the German Apothecaries of the City of New York. This association, although small in number, showed great activity, particularly in scientific matters, and many members of the

GEORGE KLEINAU.

older society became members of it. A friendly intercourse between the two societies soon sprang up. It became customary for the members of the other association to attend all scientific lectures in either of them. It was natural, therefore, that the desire to combine the two associations into one should come into existence. After some preliminary negotiations the consolidation took place in the year 1873. As the second association was an incorporated one, its name was adopted as the official legal name of the new joint society, but among the members the name of the older one remained in vogue, and has remained as the more popular one all over the country.

Such a society as the apotheker verein attracted some of the best members of the profession. The desire to do

pute. To name all the members, whose number has gradually increased to 250, would be beyond the scope of this sketch, but even the list of the presidents will at once reveal a long succession of men of high character, standing, integrity and exceptional ability.

The first president, G. A. Cassabeer, was succeeded by Albert Dung, who for many years conducted a flourishing pharmacy at the corner of Canal street and the Bowery,

WILLIAM C. ALPERS.

Presiding Officer at the Fest One of the twenty-five Kommerz for the celebration founders; once associate editor of the Sixtieth Anniversary.

FERDINAND F. MAYER.

which was at that time in the center of the retail business in New York. A few years later A. Weismann occupied the chair, and he, in turn, was succeeded by Gustav Ramperger. Both these presidents served a number of terms. We then find the names of Paul Balluff and Carl Eimer, men who represented what, even to the present day, is all that is good and noble in pharmacy. Charles Frohwein was the next president, succeeded after three years by Dr. Mittenheimer. Then came Theodore Louis, a man of sweetest disposition and tact, largely through whose influence the merging of the two German pharmaceutical societies was brought about. He was followed by Mr. Remold, who

good and excel beyond the circle of one's family and sphere of daily toil is one of the leading impulses in every man who is conscious of his ability and worth and whose ambition causes him to aim at a high, pure purpose. The roster of the society shows, therefore, names of high standing, some of men of national and international re-

in turn was succeeded by Dr. Gustav Pfingsten, who held the office for a number of terms. His energy, humor, and ready wit are well remembered by all who knew him. After H. Lehlbach had served one term, Dr. Adolph Tsheppe was called to the chair. He was a man of high ideals, stern and energetic. The next president was our friend, E. C. Goetting, who through his great activity instilled new life into the verein, and by inaugurating many pleasing social features brought about a better attendance at its meetings. Victor Kostka was the next one to con-

duct the affairs of the society, alternating for a number of terms with some of the older ex-presidents, until Carl F. Schleussner became president in 1898. The list closes with the well-known names of Carl Imhof, Felix Hirse-

plished a great deal is easily understood. And if we look over the records of the verein during the last sixty years we are astonished by the diversity of movements that have originated in this center.

man, and George Kleinau, the latter being the present incumbent.

Besides these excellent men, who as presidents conducted the verein, there deserve to be mentioned a number of others who by unremitting energy and broad views contributed their share to the high standing of the society. Who does not remember the gentle and amiable Prof. John M. Maisch, of Philadelphia? Who ever can forget the master mind of Dr. Charles Rice? Although he did more than anyone else to shape the history of American pharmacy he was always quiet and modest, unwilling to come forth into the light of publicity, but thinking and working faithfully in his quiet retreat in the dispensary of Bellevue Hospital. How could we pass over our dear friend, C. Louis Diehl, the expounder and godfather of the National Formulary? Then there were B. G. Amend, Dr. Neergaard, H. Schuman, Dr. Gustav Droegg, with his inexhaustible source of chemical knowledge, Frederick Hoffmann, George Leinecker, Carl Schur, George C. P. Stolzenberg, Emil Roller, chairman of the scientific committee, and the poet of the verein, and many others. Of the original twenty-five founders there were seven alive at the twenty-fifth anniversary; to-day only one remains at the sixtieth return of the day—Gustav Ramsperger. He is indeed a worthy, if not the worthiest, representative of German-American pharmacy, active and faithful from the first year. His name appears on nearly every page of the records, his services were true and loyal, whether as president, treasurer, trustee, delegate or committeeman. And to-day he stands among us, gray in hair, but youthful and fresh in spirit and mind, ready for any work that may be wanted of him.

That men of such energy and working capacity accom-

In the first year of its existence the difficulty of variations in formulas for many preparations presented itself in all parts of the city of New York. There was a United States Pharmacopœia, but it had scarcely any influence.

CARL EIMER.

At one time President of the Society.

B. G. AMEND.

A former Vice-President and leading member.

It could be found in few, if any, pharmacies or drug stores, nor did physicians generally know it or care about it. There were at that time different pharmacopœias in different parts of Germany. It was natural, therefore, that

prescriptions presented in one part of New York were not always filled in the same way as in another part, although both fillings might have been correct according to the method and education of the pharmacist. To overcome this variance, the association resolved to prepare a manual as a guide for its members, and a committee was appointed for this purpose. The men most active in this work were Cassebeer, Balluff, Ramsperger and John Faber. It took a number of years to come to a decision in this matter, but the manual was finally printed and copies were distributed among the members of the association and the physicians of New York. It will thus be seen that as far back as 1852 this association inaugurated the work leading to the present National Formulary; and the claims of

1859 only two. So there was not much dependence placed on a school of learning. It was then that the association formed a committee which instructed and examined young

some State pharmaceutical associations to have been the pioneer in this work can be refuted by the records of the Deutsche Apotheker Verein.

Another difficulty that presented itself to these men who were accustomed to strict scientific education and expected the growing generation to be trained in the same way, grew out of the scarcity of properly educated apprentices and assistants. It is true there were plenty of young men who claimed to know something about running a drug store, but their idea was that a drug store did not differ much from a grocery store, and that anyone who had spent a short time in either of them was qualified to open his own business. There was at that time the New York College of Pharmacy, but it was in a rather sleepy condition. In 1857 it graduated no students, in 1858 and

dates were examined, in most cases with gratifying results for preceptor and apprentice, and to the latter diplomas were given. There are some prominent pharmacists in New York now who received their education and diplomas from the committee of the Deutsche Apotheke Verein. When, later on, the college of pharmacy revived, the association took a lively interest in its development and the committee became superfluous.

In the years 1871 and 1872 an effort was made in the New York Legislature to turn pharmacy over to the politicians; to create a board of pharmacy for the purpose of squeezing out of the druggists as much as possible, without any reference to knowledge or education. The German society raised its voice against such improper legislation, and men who had spent much money, time and labor for

society took hold on the pharmacists all over the world, and to-day we have such compendiums, not only of those two pharmacopœias, but of the pharmacopœias of the

their own pharmaceutical education fought in the foremost ranks against the proposed law. It was at that time that Frederick Hoffmann and Gustav Ramsperger showed their high spirit for the advancement of pharmacy, and under their guidance, assisted by a member of the association, A. Weisman, who was also a member of the senate, a new and better pharmacy law was enacted. [See the CIRCULAR for January, 1907, page 144.] It took many

days and weeks of hard work to accomplish this object, but the repeal of the other law, which was a pernicious one, and the passing of the new law was hailed all over the United States as a triumph of pharmacy, and in many other States the pharmacists took courage to imitate the good example.

In 1874 a committee was appointed by the association to prepare a comparative compendium of the preparations of the Pharmacopœia Germanica and the Pharmacopœia of the United States, in order to show physicians and pharmacists the sometimes important differences in the preparations of the two pharmacopœias in cases in which their names might be the same, or nearly the same. Here then, we had the pioneer work in the direction of an international pharmacopœia. The idea which originated in this

HUGO KANTROWITZ.

whole world, and efforts to bring about uniformity have been fostered and have had some measure of success.

In 1878 the society took up the subject of securing exemption of the apothecary from jury service. It was joined by the college of pharmacy and by other societies, and after a hard struggle victory was won.

In 1883 the question of a manual for uniformity in preparations was again agitated in the society. Since the first manual of this kind was issued in 1852, the great abuse of ordering ready-made preparations and the numerous multiplication of such preparations of the same name by different manufacturers had created a state of affairs that forced this question on every thinking pharmacist. The German society was joined by the New York College of Pharmacy and the Kings County Pharmaceutical Society, the New York and Brooklyn Formulary resulting. This book became the property of the American Pharmaceutical Association and from it was developed the National Formulary.

In order to protect its members against blackmail the German society instituted its Rechtschutz (legal protection). In the years 1885 to 1890 there was a regular gang who tried to blackmail the druggists of New York by making claims of injury to members of their families through

OSCAR KRAUSE.

Once a Vice-President and always a philosopher of the Society; Farmer as well as Pharmacist.

PAUL ARNDT.

Chairman of the Entertainment Committee for many years; composer of original songs.

some imaginary error or omission that the pharmacist was accused of having made. It was on account of these men that this association was needed. A number of suits started against members of the association were defended, and the beneficial action of this "rechtschutz" soon put a stop to the work of these blackmailers. Later on, when insurance companies of high standing undertook similar

work, this form of protection became unnecessary, and it has since been discontinued, the association advising every member to take a policy in one of the large legal insurance companies.

The idea of buying goods jointly in order to be able to meet the inroads that department stores and cutters had made on the business of the members, also originated in this association. Various efforts were made, and a number of more or less successful stock companies were founded, until finally the now flourishing New York Consolidated Drug Company was the result.

In order to aid the families of deceased members in the payment of funeral expenses, an association has been formed within the society each surviving member of which pays a dollar at the death of any of the members.

Under the pharmacy law of 1898 the German Apothecaries' Society had the privilege of naming one of the five members of the Greater New York board, the New York and Brooklyn colleges naming two, each.

From the beginning of the association, the desire to have a journal representing its interests and giving space to its affairs had been agitated. A number of times this question was debated, but it was not until the year 1895 that practical results were obtained, when *Das Monats-Blatt des Apotheker Vereins* (Monthly paper of the Apothecary Society) was established under the editorship of E. C. Goetting. Owing to many difficulties from within and without, this journal existed only two years. Since then the *Deutsche-Americanische Apotheker Zeitung* (German-American Druggists' Paper) has undertaken to publish reports of the meetings of the society, and in a general way to advance its interests. As a representative of this paper and as a loyal, "hustling" member of the verein, Hugo Kantrowitz has done yeoman's service in furthering the interests of each.

It will thus be seen that in most events of our pharmaceutical life this association not only has been active, but has taken the initiative, and if all its ideals have not been realized, it only shares the fate of other pioneers in great things, which show the way, and leave it to later generations to take up the work and accomplish results. In many ways other than those mentioned it has showed its interest in pharmaceutical matters. From time to time visits have been made by the association as a body to various factories of pharmaceuticals or chemicals. Botanical excursions are not uncommon, and a number of collections and a pharmaceutical herbarium are in the possession of the association. A large library is also part of its inventory.

Members of the German apothecaries' society never forget those that are unfortunate or in distress, and many a time a needy brother has been helped by his confreres.

The influence of this society at the present time is great and far-reaching. Among its members there are seven of the committee of the revision of the Pharmacopœia, of whom four are chairmen of sub-committees and members of the executive committee. There is perhaps no other association in the country that can boast of so many prominent pharmacists whose influence is felt everywhere. And yet this association works quietly, and without any strenuous efforts at public recognition. It is the ideal of the founders that is indeed alive, and we trust that this ideal will remain living and active for generations to come.

Regular Monthly Meeting of the Society.

A meeting of the New York German Apothecaries' Society was held September 7th, President Kleinau in the chair.

After the minutes of the previous meeting had been read and accepted and the routine business disposed of, O. P. Gilbert, chairman of the entertainment committee, reported on the excursion to College Park and also announced that the preparations for the two festivals to be held in connection with the celebration of the sixtieth anniversary of the society had been completed. He asked the members to consider it their duty to be present at both entertainments.

Dr. Alpers as chairman of the society's delegates to the meeting of the American Pharmaceutical Association reported at length on this convention, at which the society had been represented by a large number of members. He said he hoped that many members would also participate at the Denver meeting next year. The report was received with much applause.

Otto Raubenheimer then reported on the meetings of the American Pharmaceutical Association's committee on the

National Formulary. He said that so much work had already been done in the various sessions that the manuscript very probably would be finished in three months and that the new National Formulary would be published in about six months.

E. A. Boetzel then made a short report on the meeting of the State pharmaceutical association.

After some applicants for membership had been elected a lively discussion in regard to the revision of the United States Pharmacopœia took place, Messrs. Alpers, Raubenheimer, and Roller being the principal speakers. The society decided to appoint a committee to examine all the publications of the revision committee and to report on them occasionally.

After G. T. Riefflein had thanked the society in the name of Sharp & Dohme for the artistically engrossed resolutions presented to the firm, the meeting adjourned.

The preliminary meeting to celebrate the sixteenth anniversary of the society was held on the evening of September 28th. The main entertainment, the fest-kommers, is scheduled for the evening of October 12th.

New York Retail Druggists' Association.

At the meeting of the New York Retail Druggists' Association held September 1st, the possibility of the Turley bill appearing again in the legislature was spoken of, and the consensus of opinion was that in such a case a repetition of the stubborn fight may become necessary, and that to be successful in it, members should learn to interest themselves in politics and at the coming election give their support only to such of the candidates as will promise to be friendly to the interests of the pharmacists.

On the question whether it will be advisable to reintroduce a bill prohibiting the giving of souvenirs in drug stores, the majority expressed itself in the affirmative, and as the successful issue would require a heavy outlay of money, for which the ordinary funds of the association are inadequate, it was voted to arrange during the coming season an affair which should be both sufficiently entertaining and a money-maker in the same time. A committee of ten was named to begin the necessary arrangements.

Several members reported that the board of health, after finding their spirit of camphor or tincture of iodine but slightly deviating from the standard, had subjected them to arrest and is holding them for special sessions court, with the possibility of a heavy fine and publicity. As a result of this, by a unanimous vote, a resolution was passed deprecating action of this kind, the regulation of pharmacy being provided for otherwise in the law, and calling on the board of pharmacy to show sufficient activity to "make the appearance of all other drug examiners both unnecessary and unwarranted."

The association went on record as fully endorsing Dr. Wiley.

Kings County Society.

The first meeting of the Kings County (N. Y.) Pharmaceutical Society since the beginning of summer was held September 12th, President Clarence O. Douden in the chair.

F. P. Tuthill, Joseph Kahn and Otto Raubenheimer, delegates to the New York State Pharmaceutical Association, the New Jersey Pharmaceutical Association and the American Pharmaceutical Association, respectively, made reports on the proceedings of those organizations.

There was some discussion of the forthcoming Pharmacopœia.

President Douden appointed the following members as chairmen of committees: William Muir, legislative committee; Charles E. Heimerzheim, trade matters committee; Otto Raubenheimer, pharmacy committee; William C. Anderson, Pharmacopœia committee; and Thomas F. Raymow, library committee.

Paint Men Elect Officers.

At the annual meeting of the Paint, Oil and Varnish Club of New York, held September 21st, the following officers were unanimously elected: President, A. G. Schumann; vice-president, H. J. Schnell; secretary, W. B. Templeton; treasurer, F. F. Cheesman; executive committee, L. Martin, Jr., chairman; H. Woolsey, Jr., John W. Masury, H. G. O. Dunham, R. O. Walker, H. A. Brewer, and the officers, ex-officio.

The Cost of Beauty.

It transpired in a recent widely heralded court proceeding that the fair plaintiff spent the modest sum of \$1,875 a year in disguising the ravages of time, trouble and tempests on face and figure. This amount, so an English beauty-specialist of renown told the *New York Herald*, is rather excessive; and—in London at least—women may be as beautiful as they may desire for \$500 a year. According to this authority a reasonable yearly beauty bill would be about as follows:

Water softeners (much in demand in London).....	\$500
Perfumes	125
Powders, creams and face lotions.....	125
Mouth washes and tooth powders.....	25
Manicuring and chiropody.....	250
Electrolysis	250
Face cleaning, once a week.....	150

Totals\$1,425

Changes in the Northwestern Faculty.

Following the retirement of Dr. Oscar Oldberg, the trustees of Northwestern University have appointed Prof. C. W. Patterson acting dean of the faculty of the school of pharmacy.

Prof. M. A. Miner has been appointed professor of pharmacy and director of the pharmaceutical laboratories. J. L. Clay succeeded R. G. Myers as instructor in the chemical laboratories, and will be assisted by Edward Park. C. P. Hoagland will assist Prof. Miner, and Jay Kaplan has been appointed assistant in chemistry.

In the August issue of the Special Bulletin of the North Dakota Agricultural Experiment Station it is reported that out of eighty-nine samples of spirit of peppermint collected during the past year from retail dealers and analyzed, fifty-four fell below the pharmacopœial requirement of oil of peppermint, and eighteen contained more than the required percentage of oil. Two samples contained about 20 per cent. of water. The weak preparations contained from 15.3 to 96.1 per cent. of the required amount of oil, averaging about 80 per cent. The over-strength samples contained from 7.6 to 23 per cent. in excess of the official oil content.

Influenced by reports that many people were buying methylated spirit from non-licensed venders and using the liquid as a beverage, the department of trade and customs of Australia has issued a regulation requiring that all the tax-free methylated spirit must contain 0.5 per cent. of coal-tar naphtha.

"Mrs. Mary McGrath, who died of a fracture of the neck of the fumer on August 26th, at Milwaukee, Wis., was locally reputed to have been born in 1796."—*Boston Medical and Surgical Journal*. 'Twould seem, from the nature of her injury, that the aged lady was a smoker.

Two Long Branch (N. J.) erstwhile partners, are warring merrily in the courts because one, it is alleged, did not fulfill his promise to teach the other pharmacy, and, still worse, would not let him off to attend a pharmacal school.

Phosphorus, combusting spontaneously, caused a bad fire in the store of Felix Resnick, of this city, September 10th. The druggist and his assistant were quite severely burned; and five firemen were overcome by the fumes.

The firm of Trent & Pierce, Portsmouth, Va., has been dissolved, Mr. Trent continuing the business and Mr. Pierce taking a pharmacy in another location.

Herman A. Westphal, at one time the proprietor of the Junction Pharmacy, in Jersey City, N. J., has succeeded to the business of A. A. Taylor, of Summit.

The clerks of London, Ont., have organized an association, offered as follows: President, A. Kitchen; vice-president, J. H. James; and secretary, George Taylor.

The Riker Company recently opened its tenth Boston store and a store in New Haven, Conn., and is about to open one in Bridgeport, Conn.

The Louisiana excise men are rounding up the indiscriminate sellers of tincture of ginger as violators of the prohibition laws obtaining in several parishes.

Obituaries.

JAMES T. SHUPTRINE.

James Thaddeus Shuptrine, whose death was briefly noted in our columns last month, was born in Effingham county, Georgia, in October, 1850. His early years were spent in his native county, and there he secured his education. In 1869 he went to Savannah and entered upon an apprenticeship in the retail drug business. Eight years later he went into business for himself, laying the foundation of the Shuptrine Company, of which he was president at the time of his death.

JAMES T. SHUPTRINE.

Mr. Shuptrine was favorably known as a pharmacist and a business man throughout his native State and the South. In the affairs of the Georgia Pharmaceutical Association he always took an active part, serving it as secretary 1881-3, and as treasurer from 1900 up to the time of the 1911 meeting when he resigned because of failing health.

A man in whom were combined the characteristics of the old-time Southern gentleman and the modern Southern commercial leader, Mr. Shuptrine leaves many to mourn him. Besides his wife he is survived by a son Herman C. Shuptrine, president of the National Association of Retail Druggists, and a member of the Georgia Board of Pharmacy, who was associated with his father in business.

The following are the recently reported deaths of others in the drug world:

C. T. ABBOTT, of San Diego, Cal., August 18th.

WALTER W. BALDWIN, of Minneapolis, Minn., at Stillwater, September 10th, aged forty-two years.

ADOLPH A. BENOIT, of Putnam, Conn.

JOHN CALHOUN, of Bradford, Pa., August 23d, aged seventy years.

GEORGE C. DENNIS, of Rochester, Mich., August 24th aged fifty-four years.

S. P. FRANK, of Chicago, Ill., September 10th.

MANUEL HAVA, of New Orleans, La., August 23d, aged forty-seven years.

EMMET F. JENNINGS, of Cortland, N. Y., at Madison, September 7th, aged sixty-one years.

WILLIAM STAPLETON JOHNSON, of Henderson, Ky., aged seventy-one years.

J. R. MURRAY, of Kittanning, Pa., September 9th.

LEWIS ROSENHEIN, of Chattanooga, Tenn., September 3d, aged forty-seven years.

WILLIAM H. SANFORD, of Newark, N. J., August 31st, aged seventy years.

HARRY C. STEWART, of Pittsburgh, Pa., at Moundsville, W. Va., August 26th, aged forty-five years.

GEORGE E. TAYLOR, of Leadville, Col., August 24th, aged fifty-eight years.

FREDERICK A. TURNER, of Portland, Me., August 27th, aged sixty years.

GEORGE H. WELSH, of Boone, Ia., at Clear Lake, September 11th.

JAMES D. WILSON, of Lexington, Ky., August 20th, aged fifty years.

Joseph Tetlow, of Philadelphia, Pa., manufacturer of toilet powders, died August 20th, at Amityville, N. Y., aged forty-eight years.

The Jacobs Pharmacy Company, of Atlanta, Ga., has purchased the three stores of T. H. Brannen, located in that city, for a consideration reported to be between \$50,000 and \$60,000. This move gives the Jacobs Company ten stores.

DRUG STORE MERCHANDISING

Mail Order Competition.

Druggists Could with Profit Adopt Some of the Methods of their Largest and Fiercest Competitors—Experiences of One Druggist Who Woke Up Because He Had to.

BY A TRAVELING MAN.

Mail order people distribute big catalogues through the country. The country people exchange experiences concerning the ordering of the goods. The low prices, as compared with the prices usually charged by the local druggist, astonish them and appeal to their way of thinking, even though the tempting pictured article in the neat catalogue may be quite inferior. The goods upon arrival may be underweight, poor in make-up and not worth the price paid. But the average patron of the big department store mail catalogue does not let up on patronizing the mail order company because of these reasons.

Mail order firms derive enormous gains by encouraging their patrons to buy goods in such bulk as will justify their shipment by freight and thus to save postage or express charges on small packages. Many a farmer has been known to order much more stuff than he knows what to do with in order to save fifty cents in express and have a bulky package come by freight. Druggists in country districts have all they can do in these days of mail order traffic to compete with the large city houses. They may carry better goods and may be reasonable in their prices, but the mail order catalogue will always be in the possession of their customers, and they will hear quotations from it frequently. Hence the average proprietor of the drug store in the small town or country village is studying how to keep his business at home.

In one case a druggist was selling staple lines of druggists' supplies at fair prices, and extending the usual credit to his patrons. But the catalogue infection got into his town, and his receipts fell off. He decided to make a study of the causes and effects as it made him feel like apologizing for being in business for people about him to buy so easily at seemingly lower prices by simply filling in a blank form and purchasing a money order, and forwarding them to the mail order concern. He sent off for the catalogues, studied their contents for many days, and then took a trip to the city for personal investigation.

He inquired into details so minutely as to make the salesman wonder, as he purchased articles here and there.

At last he summed up the results. He found that each large mail order house had a buyer in nearly every section of the country picking up bankrupt stocks, auction stocks and low priced wares; that many of the houses took the entire output of certain factories manufacturing a special line of goods; and that some of the houses had manufacturing plants of their own. He found organization everywhere. Goods and prices were well displayed in all advertising matter issued by their houses, and exchanges of unsatisfactory goods were made when desired. He found that the mail order people studied the pleasure and comfort of the patron every time, whether the patron was on the ground or a thousand miles away. The druggist returned home, and decided to adopt some of the plans of the mail order houses. He concluded that the only chance to compete was to make the local store as attractive as the mail order house in some distant city. He cleaned up his store, had a new lighting system put in, and the front torn out and large plate glass windows substituted for the old-fashioned panes. He set painters to work inside and out, and invested in new fixtures and devices. He then put in stocks of goods to compete with the catalogue houses, and at the same time took care to have stock of a high grade. He attempted to adopt as many of the good ideas of the mail order houses as possible without adopting any of the detrimental ones. He instructed his clerks to give every thought to the comfort of the patrons, and then saw that they did it. Unsatisfactory articles were exchanged without any quibbling. Prices were made as low as possible. New goods were constantly put in. The show window was made attractive. The advertising was increased.

This man is now doing a very comfortable business in competition with the mail order houses.

Quality as a Business Builder.

Friends make a business; customers who buy only once and then say "Never again" kill a business. Therefore, preach quality first and last. It may mean a bigger strain upon the salesmanship of the clerks, for there are a great number of people who do not realize the necessity of quality. The dealer may even have to educate his whole district, but while he is doing this he is making his progress solid; he is making friends, and if cheap goods are being sold in his district he will in time gather in those who have been bitten.

Cheap goods sell once; good goods sell always. Do not forget that. Let it sink in hard and fast.—*New Idea.*

Is Advertising an Expense or an Investment?

Financial Returns from Judicious Advertising—The Value of Knowing How—Advertising to Be Selected with Care—Some Models for Druggists' Copy.

By M. P. GOULD.

Advertising is very much like any other art, or profession, or business. Those who are so short-sighted or inexperienced as to look only at the surface are very apt to be misled.

If you watched an experienced and skillful surgeon operate you would feel that you could walk right up and take the instrument out of his hands and do just as he is doing, because it seems so easy and simple for him.

If you had seen the international tennis match between the English champion, Dixon, and the American champion, McLoughlin, you would at first have been disappointed because neither one seemed to be making much effort; yet each was displaying the most consummate skill in placing the ball in exactly the right place. If you had watched them you would have felt sure that you could step right out on the court and do as well.

When you hear a great orator, his language is so simple, his manner so natural, his inflection so appealing that you feel that you could step out before the audience and move them as he does.

You read in the papers that a man who invested one dollar in the Calumet and Hecla Copper Mine has stock now worth \$30,000 in return for that one dollar invested.

You read that Andrew Carnegie, a poor boy, has earned some money, then invested it in steel companies and gradually worked up until now he owns \$300,000,000 worth of steel corporation bonds.

You read that the owner of one of the most successful cereals on the market was a very poor man and regarded as a failure in life, until he got hold of the way of making this cereal. He almost mortgaged his own soul to get the money to begin advertising this cereal. He now is said to spend nearly a million of dollars a year in advertising, and when his daughter was married, he endowed her with \$3,000,000. No-

body knows how much he is really worth now.

It all looks easy. The surgeon's skill looks easy. The tennis champion's skill looks easy. The orator's skill looks easy. The investor's skill looks easy. The advertiser's skill looks easy. Yet if the truth were known, nearly every great achievement represents the most persistent and self-sacrificing effort. It represents the courage to keep on. It represents a stout heart that will not give up when everybody else loses faith. It represents almost unbelievable self-sacrifice—the subserving of almost all other ambitions and pleasures to the one thing desired.

All of this preliminary is to try to get you to fully appreciate the fact that to most of us—ninety-nine out of one hundred—advertising is an investment. It is not a gamble. It is not a "flier." It is not even an expense. It is a plain simple investment.

As an investment, advertising should be considered very carefully. If your banker should some day tell you that he could sell you the bonds of a local street car company, or water works, or lighting company at 80, and that they would carry interest at five per cent., you might be inclined to look into his proposition. If that banker were

Says the Doctor

"When I diagnose an ailment and write an order for suitable medicines, I expect certain results if the druggist does his part by carefully compounding purest drugs."

And the Patient

Selects his druggist as carefully as his doctor, and trusts that druggist to serve him equally with the doctor.

If we put up your medicines both doctor and patient are satisfied.

Confection Perfection

The kind you like, in the way you like
—in bulk or boxes.

THERE'S a difference in candies, not only in looks but in taste—and what a big difference there is in quality. We think we have real candy perfection—purity, richness, cleanliness and quality say so. We want you to decide this yourself by trying some of our confections now. In bulk or in boxes as much as you want.

Right next to the Fountain.

(Name and address)

to offer you some mining stock at nine cents on the dollar and promise you that it would pay two hundred per cent. dividend, you would stop banking with him, you would believe that he was either a crook or an unreliable banker. In either case, you would not want to deal with him.

If, therefore, an advertising man comes to you and tells you that should you invest \$100 in the advertising of your store in his paper, it would bring \$5,000 profit to you, it would be your duty to look upon him as either a faker or ignorant of the province of advertising or wholly unreliable.

Now, do not forget that enough advertisers do get \$5,000 back on \$100 investment; but the probabilities are that if you get twenty per cent. dividend on what you invest in advertising, you will have made a splendid investment.

I imagine that a great many retailers feel that if they could not get twenty per cent. back from their advertising investment, they would never go into it. Nevertheless, there are very few other means of investing money that will yield twenty per cent., or even one-half of twenty per cent., and be safe.

Some retailers who advertise do not increase their business any; perhaps their sales decline. When you study a case of the latter kind you will nearly always find that the neighborhood is changed, or a better store has come into the locality, or the store-keeper is getting old, or he does not employ good clerks, or some of his employees are taking his profits, or he is not a good buyer, or his stock is not kept up. There are dozens of causes for the failure of advertising to produce. Very often advertising does not produce because the particular advertising used does not fit the store advertised. In that case every person who answers an advertisement does not find in the store the things to be as advertised—that is, he finds that the advertisement is not truthful; that therefore, the store itself is probably not reliable; that it is not a good place to trade. Therefore, to advertise in such a way is a successful method of driving trade away from a store. Another kind of advertising could have been prepared—a kind making use of the exact conditions of that particular store and calling attention to the store's real service. In such cases, the customer would find that the store tallied with

15 DEPARTMENTS

Make the Most Complete Drug Store
Possible, where Everything Drug-
storey is to Be Had.

“Get It Where They’ve Got It”

WITH every necessary department, “The Complete Drug Store” is in a position to supply all your drug store wants. Our accommodations, appointments, conveniences and facilities are the best; you will find satisfaction here. We offer you:

1. Expert Prescription Service
2. Rare Drugs and Chemicals
3. Surgical Instruments and Appliances
4. Guaranteed Rubber Goods
5. High-grade Toilet Wares
6. Distinctive Stationery
7. Veterinary Supplies
8. Tempting Confectionery
9. Photographic Supplies
10. Selected Cigars
11. Delicious Soda Water and Ice Cream
12. Satisfying Cutlery
13. Telephone Buying

(Name and address)

the advertising, that the advertising was truthful, that the store must therefore be reliable, and therefore a good place to trade.

The writer has seen some marvelous results from retail store advertising. He has seen a clerk start a new store in competition with his old employer, spend \$100 in advertising, take in \$270 the first day, and have a regular business thereafter considerably bigger than that of the old store which he had left. But the clerk knew the conditions of the old store exactly; knew wherein it failed to serve the public of its locality; and deliberately planned a store which by contrast would make the old store seem out of date and wholly unsatisfactory. The advertising of the new store was also made to attract attention to the superior facilities of the new store in the lines wherein the old store was deficient.

However, taking advertising as a whole and in general, the store which has an established trade, which is holding its own, which can successfully compete with other stores in the vicinity, ought to be happy if it received twenty per cent. return on its advertising investment—such return to be clearly traceable and known. Because for every dollar of direct return from advertising, there should be \$10 or \$15 indirect return. Your trade increases. Only a small percentage of that increase can be traced directly to advertising. As a test, some day advertise some popular article. Your advertisement may cost you \$20. You may sell \$10 worth of the article advertised. Deducting the cost of the advertised article from the profit on that article you will have about \$3.50 actual direct return to apply as a dividend on your \$20 investment. Yet look at your total sales for that day. You will find that for some reason they are large. You can trace only \$10 of direct sales to the advertising, yet your total sales have increased \$35 or \$40 or \$50 or \$100. Where did the extra come from?

In general advertising, such as is done in magazines by national advertisers, it is common to regard one reply for every dollar paid for advertising as a very fine showing. Indeed many a man who pays \$5,000 for advertising will only get three or four hundred replies. Yet his business will increase. He will open up accounts with a large number of dealers who never favored him before. His business will show a very healthy condition. He will feel that the \$5,000 was well invested; that he got an adequate and satisfactory return for that investment. Yet he gets a smaller percentage of direct traceable returns than does the retailer.

If you will consider your advertising as an investment, and guard it exactly as you would if you were buying five per cent. gold bonds, then you will get far better results from your advertising; if you would regard advertising as an investment, and expect only a small safe return, then all that you get over that will be so much condensed inspiration to make you push forward with more ambition and more desire to get a better service and to be somebody in the world of retail merchants.

When a retailer becomes firmly convinced that advertising is an investment, then he studies various advertising policies, trying to determine what policy will attain the biggest success in three or five or ten years.

Nothing is more unwise than to put an advertisement in the paper to-day and expect it to give you a big day's business to-morrow. The farmer does not plant his corn to-day and go out to husk it to-morrow. He does not drill in his wheat to-day and go out next week with his self-binder to cut it. He knows better. Nevertheless the country is full of merchants who disregard all the natural laws of investment returns the moment they take hold of advertising. They seem to think that advertising is a magic wand to wave over the commercial world and bring sacks of money to them. Is it not about time to wake up? The story is told of one of the biggest and best known manufacturing plants in the world, that the president, the treasurer, the advertising manager and the sales manager devoted two entire days to the writing of one advertisement of 250 words, which was to be mailed to a million business men. Of course, the ten dollar a week advertising writer would have dashed off those 250 words in ten minutes, but the officers of this great corporation, with its thousands of employees and its hundreds of branches, considered advertising as such a tremendous investment that all their duties could be dropped and the head officials could have two days' labor over all of the ins and outs and the pros and cons and the advantages and disadvantages of every word in the 250, so that when that

announcement went to the business world, it would reflect the brains of that entire organization.

What policy are you pursuing? Are you filling your advertising space from day to day with the product of the mood of that moment, or are you spending days in determining the policy of advertising that will ultimately make your business most successful? Then, are you strengthening your courage to proceed in that kind of advertising, month after month, until your judgment shall be amply justified and the crown of success will come to you for your foresight and shrewdness?

It is worth working for. Who cares anything about being an "also-ran"? Who wants to sit by and have Jack and Tom and Jim and Harry spoken of as the big successes in their town—in their line—and nobody ever refer to himself or point him out as the leader in his locality? The man who is satisfied with that kind of ambition is the sick man—his body is sick or his mind is sick. For such a man has a dead ambition.

Advertising is the most democratic thing in the world. The greatest store in the greatest city advertising in the greatest newspaper cannot prevent the smallest store in that city from putting its little inch advertisement in the same paper. No matter what store in your town is bigger than you are, you can buy space in the paper in which it advertises. You can appeal to the same people who trade at that store. You can ask them to come to your store. Your advertisement will be read. If you have advantages, you can tell what they are. Nobody can prevent you from properly putting your store before the buyers of your locality.

That is the thing that through years and ages people have been waiting for and wishing for. Any dealer can be himself. He can make just the kind of a store that he wants to make. He can advertise it in the way that will make the kind of reputation he wants his store to have. He can cut out his own future and develop his store along the peculiar lines that please him most. There is nothing to prevent it. If he has not the money it simply takes him longer. Money is not what holds a store-keeper down. Lack of ambition is what keeps him down—lack of brains. Men are not created equal. Men are not even created with equal opportunities at the start, but in this country every retailer has an opportunity to advertise his store. The means of advertising are so varied, so simple, so suitable to every demand that each and every retailer can find a form of advertising which will just fit his case. Then, if he studies his whole district or locality, studies the other stores, sees just where their weak points are, he can make his store overcome those weak points. Then he is using the same kind of intelligence that he would use if he were going to invest all of his money in bonds or stocks.

When a majority of retailers will study advertising as an investment and put their money into it as though putting it into sound securities, we are going to have far more satisfaction with advertising, far better results from advertising, far more faith in advertising.

Honesty as Policy.

Within ten years' time the thought has gone through the entire business fabric that to cheat and get caught is really a worse calamity than to get caught. To be caught means that you are headed for the precipice on the high clutch and down grade. To cheat another is to cheat yourself.

Theology did not teach us this, for precept and preaching never touch our lives. We shed them. We are moved in only one way, and that is by self-interest. Cut off our food-supply and we are no longer apathetic.

And self-interest is a form of selfishness; it is the desire for life. It is the instinct of self-preservation in action. It was all a matter of mental growth, evolution. The discovery of truth as our most valuable business asset is the one great achievement of the age in which we live. For truth there is no substitute, and this discovery was made by business men.—Elbert Hubbard.

It pays to study the advertising pages of the publications of national circulation, and to put to the front the seasonable goods which readers of these pages may have been more than half induced to buy. When the dealer with the goods and a man or a woman with an inclination to buy, meet, the cash register bell should ring and a profit be written on the books.

Good Treatment for Drummers.*

"Civility" is a word that can be made to cover a multitude of faults. If there are any good judges of human kind, they are the traveling salesmen, whose vocation takes them to all parts of the land, and among all classes of people. It may be said that the average commercial traveler appreciates kind treatment fully as much as he does an order. He is out to sell goods, and in most cases to sell them he must show them.

There are many merchants who look upon the traveler as a thing of annoyance, and through their short-sightedness cannot discover that there is scarcely a man on the road but is a walking work of reference, and filled with information that is particularly useful to the man in trade. You may be stocked up with all kinds of goods. You may have a lot more on the road and feel that you would be taking up the traveler's time and your own to no advantage, should you stop to talk with him for a few minutes. With this foremost in mind, you cut him off short, treat him as if he had no business in the store, and perhaps he goes out ready to tell the next brother traveler that he meets what a boor you are.

Brother retailer, it always pays to be civil. It is less wearing on the nerves, and makes a far better impression upon those you meet. Use the glad hand freely. It doesn't cost you anything other than a minute or two of your time. Then, there may be some good thing that the traveler has up his sleeve and may make some money for you if you will only stop and listen. Anyway don't be grouchy.

Pushing a Line of Home-Made Toilet Preparations.†

Every pharmacist ought to run a series of his own toilet preparations. It is on the individual note that the pharmacist scores. The frequently recurring question, "Is this your own make, Mr. —?" shows the value the public attach to the pharmacist's personality. It is his strong point; it should mark all his dealings; it should be suggested by everything in his pharmacy, and by everything that goes out of it. Nowhere is there greater scope for it than in the field of the toilet specialty. Yet how infrequently does one find this utilized.

A toilet series may consist of perhaps four lines, or it may run to a dozen. A good title is essential. Sometimes the name of the pharmacy may be used with advantage. When one can be sure that one is the first in the field, the name of the town or district often does more for the sales than realms of advertisement copy. The pharmacist's own name is in many cases the most useful title to adopt. The fancy name, though when carefully chosen often very distinctive and attractive, needs warily seeking for. "Madame A—'s —" and "Professor B—'s" are played out, and a truly original name is difficult to meet with. I suggest, for convenience, that we make "Le Beau" our man, and that we choose as many preparations as will be most suitable to our own business from the following: Liquid dentifrice, dental cream, modern dental powder, skin cream, cold cream, benzoin cream, shampoo powder, liquid shampoo, hair wash, toilet paraffin, and brilliantine.

To deal with the dentifrice first. A liquid dentifrice offers a scope for much discrimination in the flavoring and can be easily put up in a neat and classy style. Moreover, it shows good profit. Here is my formula:

LIQUID DENTIFRICE.

Salol	℥ss.
Spt. vini rect.....	℥xxviiij.
Ol. menth. pip.....	℥iss.
Methyl. salicyl.....	mx.
Ol. caryoph.....	mxxx.
Ol. cassiæ.....	mxxv.
Saccharin (soluble).....	℥ss.
Aquæ dest.....	℥xij.

A salol preparation needs careful adjustment. The proportion of saccharin is a delicate item; this dentifrice should not suffer from over-sweetness. A sweet dentifrice is sickly; 15 grammes to the pint of 60-per cent. spirit makes a preparation sweet enough for the general taste. It should be colored with magenta solution. Le Beau's dentifrice becomes its own advertiser; a delicate red tint and a neat little label—the plainer the neater—on a heavy

paneled bottle. At present prices this will cost about 7 shillings [\$1.75] per quart. Using 2½-ounce bottles at 12 shillings [\$3] a gross, and 5-ounce at 15 shillings [\$3.75], and selling at 1 shilling [25 cents] and 1 shilling 9 pence, [43 cents], the profit works out at 92 per cent. and 95 per cent., respectively on the outlay.

DENTAL CREAM.

Mellis	℥xxviiij.
Aquæ	℥xl.
Liq. cocci cact.....	℥iv.

Melt the honey, mixed with the water and the liq. cocci, at a gentle heat, then strain through a fine sieve. Raise the mixture nearly to the boiling point, and add the following ingredients, previously intimately mixed:

Pulv. benzoin.....	℥j.
Pulv. rad. iridis.....	℥iv.
Calc. carb. præcip.....	lb. j.

This should be heated on a water-bath for one hour. When cooling, but before it has become too stiff, add:

Menthol	gr. xx.
Ol. gaultheriæ.....	℥ij.

Dental cream requires care in the filling of the tubes. A leaky tube is the worst of advertisements and a danger to all stock in its immediate vicinity. With care it can be made a good thing. Here again the secret of success lies in the flavor. The above is good. The following is my

MODERN DENTAL POWDER.

Thymol	gr. x.
Spt. vini rect.....	q.s.
Cretæ præcip.....	lb. j.
Pulv. os. sepiæ.....	℥iss.
Pulv. sapo dur.....	℥j.
Mag. carb. pond.....	℥liij.
Magnes peroxid.....	℥vj.
Ol. rosæ geran.....	℥ss.

To insure thorough admixture the thymol should be rubbed down with a few drops of spirit and a little chalk, and then well incorporated with the rest of the powders. If the peroxide is rubbed up with the os sepiæ its complete diffusion through the whole will be facilitated. Every care must be taken to keep the ingredients perfectly dry; a very slight trace of moisture will cause loss of strength in the active principle.

The tall, American-pattern, nickeled-metal boxes, which are indispensable where the bulk of the powder has to be kept perfectly dry till it is taken for use, can be obtained at about 3 shillings 9 pence [93 cents] per dozen; they hold about 3 ounces. I find that, using 1 pound of chalk, the cost works out at 1 shilling 6 pence [37 cents] per lot, making seven boxes. Selling these at 1 shilling [25 cents] gives a profit of 100 per cent. on the outlay.

A GOOD SKIN CREAM

and especially a rub-in-smooth cream, is a sure seller and a handsome profit-carrier. There are several preparations on the market at present which are offered as a base for this class of cream. Such as I have tried are very good, and make useful creams. The original stearin formulas are excellent, but need much care in preparation. My formula is:

Dissolve 180 grains of sodii carb. in 10 ounces of water and add, melted, 2 ounces stearin. Boil the mixture for ten minutes and add liq. hamamelidis, 10 ounces. Raise this to boiling, stirring constantly, and when well frothed pour into a large jar and whip well with an egg-whisk till cold.

The whole success of the preparation lies in whipping plenty of air into the liquid at first. It is better to have the cream at least twelve hours before adding perfume, as there is often a slight settling down of the mass. Half a dram of ess. rosæ gives a distinctive odor. If a good perfume is employed the scent is better than can be obtained by the use of the pure otto. It is a good plan to prepare this cream in several varieties; a lavender scent is something new, which I have found appeals to some ladies; an eau-de-cologne cream is also a satisfactory article. What I have found almost more successful than any other scent is a delicate blend of coumarin and heliotropin. This skin cream can be put up either in white celluloid-covered pots, or more effectively in fancy glass jars. A special name seems to help the sale of this line considerably. I suggest that for this series we dub it Le Beau's dermic snow. That has settled it as a sure seller! The addition of 3 drams of liquid paraffin, the reduction of

* From the Price Current.

† From the Chemist and Druggist.

the hamamelis to 2 ounces, and the substitution of a couple of drams of tinct. benz. simp. give a splendid *benzoin cream*. With this quantity of tinct. benz. other perfume is unnecessary.

SHAMPOO-POWDER.

formulas are much alike. The quantity of alkali should not be more than 25 per cent. I have known shampoos, with a considerable sale, which consisted of at least 50 per cent. sodæ carb., but in use they proved very harsh. It is better to give an excess of borax. One pound each of borax and soap-powder with about 4 ounces of sodæ carb. give the best result; 15 grammes of coumarin with half the quantity of heliotropin gives a perfume which is much admired. Put up in plain neat envelopes and boxed in sevens to sell at 1 shilling [25 cents], this line scores by its distinctive scent.

Le Beau's antiseptic liquid soap is simply a 75-per cent. solution of soft soap in alcohol, scented with ol. lavandulæ, and made antiseptic by the addition of 1 per cent. of acid. carbol. liq. [This may cause gangrene when applied to wounds (see page 573) and should be replaced by some other antiseptic.—Editor THE DRUGGISTS CIRCULAR.] The word "antiseptic" takes the public fancy. A large sale cannot be expected for a liquid soap, but a good deal can be made out of it by pushing it for shampoo use, etc. It pays to sell it where possible.

TOILET PARAFFIN.

has some devotees, and may be thought worthy of inclusion in the series. It is simply liquid paraffin scented either with violet or the coumarin-and-heliotropin combination. The same note applies to *brilliantine*.

ADVERTISING.

Now as to advertising. It is unnecessary to do much. Give a prominent place, on your counter or show-stand, to Le Beau and his goods, and recommend him to the hesitating customer. Let his goods be sold more on your recommendation than for any other reason. Keep him well to the front and let him wear always the air of being Le Beau—something superior, something classy. Let him be the aristocrat of your stock of toilet preparations. His goods are sure to sell. Get out a neat little folded card, if you like, and tell off the points of his things therein.

Getting Rich in the Drug Business.

One of the quickest and easiest ways to make money is to borrow capital from the bank at 5 or 6 per cent. and invest it in some way that will make it yield two or three times that much, or even more.

Suppose, for instance, a druggist is doing a conservative little business which yields him a net profit of \$1000 a year after paying him a salary of \$100 a month. This druggist borrows, say, \$10,000 from the bank, invests it in fixtures, a larger store and advertising, and so increases his net profit to \$2500 the first year. He pays the bank \$500 for interest, and still has \$1000 a year more than before. By putting this \$1000 back into his business, his extra profit is still greater the next year, and so on until the annual profits of the store amount to \$5000. In the mean time partial payments have been made on the \$10,000 loan, reducing the interest as well as making the principal smaller and smaller until at the end of ten years the debt has been liquidated and the store is doing five times the business it was before the venture was made.

Of course not every druggist could do this. Doubtless many a man would lose not only the \$10,000 borrowed, but the store which he put up as collateral. But that some shrewd young business chaps have succeeded in doing practically what is here outlined there is no denying, and that others are doing it and still others will do it none can gainsay. The man who doubts his ability to "make good" had better stick to his \$1000 a year business, which is not bad, while the one who feels cramped by small quarters and dissatisfied with sales of from \$15 to \$25 a day, and knows that he can do better and that he is going to do better, can probably raise the money and become the head of a \$100-a-day business.

Post cards sell themselves, although a little pushing of this line shows results. The stock should be kept up-to-date, both as to designs and cleanliness. The profit on post cards is large, and very often the sales mount higher than five or ten cents per customer.

The Cost of Doing Business.

Many Items of Expense Frequently Overlooked by the Druggist—Discounts, Depreciation, and Proprietor's Salary—Rule for Determining Gross and Net Profits.

By E. FULLERTON COOK.

While there is an increasing recognition by druggists of the necessity for knowing absolute cost, that a profit-making selling price may be determined, yet there is room for renewed emphasis and more discussion. The golden key which unlocks with certainty the storehouse of profit in modern business is intelligent and scientific management.

Much has been written and preached about advertising, including store arrangement and window displays; many new plans for buying goods have been offered and put into successful operation; and these are of great importance, but they are only part of a manager's problem. Before him stands the whole ultimate question of profit and to conduct the business so that all divergent forces are harmonized and this result accomplished must be his constant endeavor.

The right proportion of "first cost," expense per cent., and profit per cent., in the fixing of the selling price, scientifically applied, assures this result, and is the real question for adjustment.

FIRST COST.

No attempt will be made here to discuss the "buying of goods," however important a factor that may be in profits. Needless to say the cheaper the price for which the goods can be bought by the dealer, quality being equal, the more likelihood there is of a profit-making and sale-inviting price at retail.

CASH DISCOUNTS.

In this connection "cash discounts" may not be overlooked. A few years ago they were ignored by druggists generally, but the testimony of many to-day who are successfully solving the bigger problem of profits has proved beyond a doubt its advantages. It means "best buying prices," good service, independence, profits and, most important, freedom from the harassing worry attending unpaid bills and accumulated debt.

EXPENSES.

Expenses big and little should be under absolute control. They should be systematized, classified and, so far as possible, anticipated. At the beginning of the year, when percentages are being figured for the fixing of a profit-producing selling price, all expenses not fixed should be estimated from previous experience, appropriations made and accounts opened, care being taken to see that the appropriation is not exceeded if the expected profit is to result.

FIXED EXPENSES.

There are certain fixed expenses in all businesses. These should be carefully determined. The following are the most important:

Rent.—This must be charged if the property is owned by the store proprietor as conscientiously as if paid to a landlord. A rental equal to that obtainable in the neighborhood for similar property will be a satisfactory guide to the amount to charge.

Clerk Hire.—This important item requires constant attention; certain stimulating expedients often make it possible to reduce the expense through the securing of better service from a less number of assistants. This involves the much-talked of science of efficiency.

Insurance.—Few business men can afford to ignore insurance. It is a necessary and legitimate expense and should at least include fire and indemnity insurance, the latter being exceedingly valuable since it affords protection in case of errors, or a claim of error with attempted blackmail.

Taxes and Licenses.—These must be included with other expenses.

Telephone.—An expense of every modern business.

The preceding are the more common fixed expenses, but there are others not always recognized, as:

Proprietor's Salary.—A stated amount should be charged regularly as salary for the proprietor if he is giving his time to the business. If he is not devoting his energies to the work of the store he is certainly paying some one

else to do it, and it is but fair that he who does assume the responsibility, work, worry and risk of loss should be the best paid man connected with the business. He should not wait for expected profits to give him living expenses.

Interest on Investment.—This is another item of expense which is often ignored, giving false ideas of profit. Of course, if the store is being conducted with borrowed capital the interest is charged to expenses, but it is equally legitimate and necessary to charge interest for investment when the capital is supplied by the proprietor.

Fluctuating Expenses.—Besides these fixed charges there are many others that arise from time to time, some seemingly trivial, but all worthy of careful accounting and watching. In fact, where business is planned on a low percentage of profit these incidental expenses may unwittingly increase until they have entirely swept away gain which might have been expected. It is recommended, as has already been suggested, that appropriations be made at the beginning of the year for such expenses, and that these expenses then be regulated so that the year's close will not find the appropriation exceeded.

There will be many leaks stopped if all know that a strict accounting is being kept of every cent expended. Items belonging to this class are light, heat, stationery, labels, stamps, delivery, freight, drayage, advertising, donation, shortage, breakage, failure to charge and bad accounts, which are difficult to estimate, but cannot be ignored; careful management, however, will reduce them to a minimum.

The importance of guarding against unnecessary expense is emphasized by a moment's study of profits. Suppose the sale of \$100 worth of goods figures out about as follows (and this would be considered an unusually good average for the retail business): First cost 70 per cent., expense of selling 20 per cent., net profit 10 per cent. It can readily be seen that \$5 saved in expense is equivalent to the profit on \$50 worth of goods sold over the counter and, if the profit per cent. is only 5 per cent., the saving of \$5 is equal to the profit on \$100 worth of goods.

Such a viewpoint puts a new light on expense, and every clerk should be made to see expenses in this light.

Depreciation.—Depreciation is another item which must be counted in the year's expense. Usually 5 per cent. is counted off the value of fixtures and about 10 per cent. from the soda water apparatus, while it is often necessary to allow for depreciation in sundries. This is based upon the likelihood of entire replacement of fixtures within twenty years and the buying of a new soda fountain in ten years. It is practically creating a sinking fund, a sound business principle.

PROFIT.

Knowing the first cost of goods sold throughout the year and the expenses incurred, from all sources, to place such goods in the customer's hands, it is not difficult to determine the percentage ratio between cost and expense. Unless there has been added to the "first cost" at least a percentage equal to the percentage of expense, in fixing the selling price, there has been a positive loss for each sale. But a business man cannot be satisfied with only covering expenses; he must make a profit. He must add to his "first cost" the percentage of estimated expense and then the percentage of profit he desires, and this will give him a properly determined selling price and insures a legitimate profit. I say a "legitimate profit," and a man in business is justified in expecting a fair profit, for it is a sinking fund upon his own life which will probably become incapacitated, on the average, in from twenty to thirty years.

A profit is really figuring depreciation on life, making it possible to retire with some accumulated reserve after a reasonable number of years of activity.

INVENTORY.

This, however laborious it is to take it, is necessary for a right adjustment of the various interests of business. The drug business has been slow to recognize this, but right business methods are being introduced in many stores and its worth is acknowledged. Not only does it insure a correct statement of the condition, but it keeps the stock from stagnating, helping to prevent accumulations which are often deceptively figured among the assets.

FIGURING PROFITS.

The important factors for determining profit are the inventories at the close of the preceding year, the current

inventory, the "first cost" of goods bought during the year and the total expenses of conducting business during the same period. With these factors determined the following rule will show gross profit or net profit:

RULE TO DETERMINE PROFIT.

First deduct from the year's purchases any increase in the stock or add to the year's purchases any decrease noted by comparing the inventories, thus determining the cost of goods actually sold. Then:

The gross profit is obtained by subtracting the cost from the year's sales.

The net profit is obtained by subtracting the expenses of the year from the gross profit.

It may be graphically shown as follows: Let S equal sales of year; C equal cost of goods sold; E equal expense to do business.

Then $S - C =$ gross profits, and $S - (C + E) =$ net profits.

"Chain" Stores Do not Mean the Extinction of the Small Retailer.

At the recent meeting of the New York State Pharmaceutical Association C. A. Drefs, Sr., of Buffalo, read a paper entitled "Competition of the 'Chain' Store." In the discussion which followed the reading of this paper diverse views were expressed, as was to be expected. This discussion is reported in the CIRCULAR for July, page 389, under "Fourth Session, Wednesday Afternoon."

Mr. Drefs himself expressed the optimistic view that great possibilities are open to the individual druggist who will strengthen the personal equation in his business. He believed that men still outrank methods in influencing the public to make a success of a drug business.

Members from this city were inclined to be pessimistic on the subject, but Thomas Stoddart, another Buffalonian, whose personality, together with that of his brother, had enabled them to build up a magnificent business, considered the "chain" store to be a stimulant rather than a depressant to the retail druggist, and placed a high value on personality.

H. B. Guilford, of Rochester, at that time president of the National Association of Retail Druggists, contended that the tendency to "fly too high" at the start wrecked many projected drug businesses. He said that opportunities in drugdom were never so plentiful, if the druggist will but apply himself strictly and earnestly to business.

Prof. W. C. Anderson, of Brooklyn, expressed the belief that such competition as the "chain" stores represented did not apply to any extent to the real pharmacy of the drug business and therefore the individual druggist's effort should be to expand this part of his trade. He praised propagandic work as a very helpful undertaking in this connection.

To the foregoing may be added that a leading spirit in one of the big "chain-store" enterprises in this city has said that the big down-town cut-rate stores have helped the small retail druggists by preventing the shopping public from stampeding from the drug stores to the department stores for its toilet articles, druggists' sundries, fancy goods, and even drugs and medicines. The public being induced to continue purchasing at drug stores, he argued the smaller establishments receive a greater share of the patronage than they would if the department stores were permitted to have things all their own way. Maybe there is something in this.

One druggist clips advertisements from the prominent periodicals every few weeks and pastes them on his windows. At the top of each group is the cover, with a few of the advertisements taken from it pasted below. From each of the advertisements a ribbon leads to the article itself.—E. C. Patterson, in *Collier's Weekly*.

Let every man who would build up a good business in "own-make" toilet goods, look to his packages. Pretty, neat attractive containers and labels made in the highest style of the art are demanded in the toilet goods department more than in any other part of the store—and they are needed in every part.

No merchant need hope to grow rich by selling goods unless he sells to the same customer more than once, and the customer does not have to come back, and probably will not, unless he is pleased with what he received the first time—in goods, service and surrounding.

Boosting Hot Soda.

How to Make the Most Money Out Of It Directly and Indirectly—Daintiness a Prime Requisite, and a Reputation for All Goods Necessary—Window Streamers Help.

BY AN OLD HAND AT THE BUSINESS.

I have shown the dollars-and-cents importance, and the trade-holding influence of the hot drinks, and I have made it plain that the equipment-cost is small and the margin of profit large.

Now I shall apply the facts already stated to the test of daily practice, to see if some common-sense ways and means of getting the most for our money cannot be discovered

DAINTY SERVICE.

Perhaps it is not too much to say that the first requisite to success in the hot-soda business is dainty service. This is even more vital in the hot-soda business than in selling cold soda, because the hot drink in itself lacks the charm of form and color that are so potent in the business of serving sundaes and ice-cream sodas.

The dispenser should use only thin decorated china-ware—real china. The china tray with cup at one end and a little pile of wafers at the other is popular and has the advantage or justifying one in charging 10 cents for an ordinary bouillon that might look like only "5 cents worth" if served in a common cup and saucer.

Then, too, he should use dainty silverware and see to it that it is bright and clean, with none of the plating worn away until the base metal underneath shows. In this connection let me suggest that it is never wise to buy silverware that is plated on a brass base, but to insist on a white metal or brittania base. Some spoons will be stolen, of course, but the loss of business that will come from the use of a too cheap style of spoon will be greater than the money loss due to dishonest or "Smart Aleck" patrons.

A paper napkin and a glass of ice water should be served with each cup of hot beverage, and salt, pepper, paprika and celery salt should be within reach, on the counter or table.

Hot chocolate, cocoa, malted milk, coffee, and perhaps even tomato bouillon should be topped with whipped cream. Marshmallow cream whipped up with milk is delicious, especially with cocoa, and it costs less and is easier to keep than straight whipped cream.

CHOCOLATE DRAWING CARD.

Let the druggist once acquire the reputation of serving a rich, "flavory" cup of chocolate, and feature it in his advertising, and he will be delighted with the result. He should be able to make chocolate better than that served by any but the highest-priced restaurants, because he may make it a little at a time, instead of by the wholesale.

LUNCHEONETTE FEATURE.

As I have intimated before, the greatest possibilities of hot soda lie in the service with them of sandwiches and other light luncheon dishes or dainties.

I know druggists who are making twice as much money out of their hot soda and luncheonette departments as they are from their drug stores proper; and the sale of drugs and sundries is tremendously helped by the purchases made by the soda fountain and luncheonette crowd.

HOT DRINKS MUST BE HOT.

Lukewarm water is an emetic, because it nauseates. Lukewarm "hot soda" is almost equally disagreeable. Hot soda must be served *hot*, and in order that this may be done the dispenser must be provided with the right kind of urn, and the right kind of burner under it; and he must watch the thermometer.

All the supply houses sell one-, two-, and three-compartment urns, each with a "chocolate warmer" on top. My observation is that the compartment in the body of the urn may be kept at the boiling point, and the chocolate warmer at the top be still nothing more than a *lukewarmer*. Such a compartment should therefore not be used for chocolate but for milk, as milk should not be too hot.

Many dispensers cook the milk in with the chocolate, but my own preference is to keep the milk out of it until I am ready to mix the ingredients in the cup.

DON'T MONKEY WITH TOY URNS.

Because the beverages *must be hot*, my advice to all dispensers is not to waste any time with the very cheap urns and the 50-cent burners that usually go with them; but to invest from \$30 to \$50 for each duplex or triple urn, and to fit each urn with a good-sized gas burner.

It is better for a druggist not to try to serve hot soda at all than to serve it in such way that a customer will never come back.

BOOSTING THE BUSINESS

The margin of profit on the hot drink is so liberal that one can well afford to "plunge" a little in advertising. If the druggist has a large down-town store he can use the local newspapers at a profit, and in most cities cards in the street cars as well.

WINDOW STRIPS AND POSTERS.

Whether down town or in a residence district, the hot-soda dealer should make full use of his show windows. All the soda supply houses and the makers of various materials for the hot soda department are liberal with window strips, hangers, show cards, etc. If the supply they ship with the goods is not sufficient, they will send more if requested, as I have found them to be glad to co-operate with the dealer who is showing their goods. It helps the sale of beverages to keep the windows well decorated with their strips, supplemented with strips of the druggist's own making. Appropriate black crayon marks on long strips of roll wrapping paper make good advertising strips.

IDEAS FOR WINDOW ADVERTISEMENTS.

Let us suggest some phrases because these in turn will lead any ingenious advertiser to coin some of his own that will be still better:

Shivery? Come in for a Hot Bracer.

*Food and Drink and a Cheery Comfort—
a glass of Hot Malted Milk.*

*Our Hot Chocolate is Different from Most
Chocolate—and Better.*

*A man walked a mile to get a cup of our Hot
Tomato Bouillon and said it paid him.*

*Hot Beef Tea—Sounds "hospitably" but tastes
"homey" and gives you a "come-again" feeling.*

*We use Beef Cubes—you make your own Beef
Bouillon and season it to suit yourself.*

*A chill is the open door to a cold. Close the
door by stepping in for a cup of Hot Cocoa.*

CIRCULARS AND MENU CARDS.

Let the dealer get up a menu of say a dozen leaders, and then have a neat circular printed about his hot-soda department, luncheonettes, etc. In this he should tell how he prepares each of his specialties, what fine materials he uses, etc., not forgetting to feature his cold sodas and ice cream in the same circular. He should mail one of these to every housewife in the district which is his natural territory, and if he wants quick action, he should en-

close a ticket, or incorporate in one corner of his circular a coupon entitling the holder to a 10-cent drink free. By all means let him arrange this ticket or coupon so that the user must write her name and address on it before it is redeemed—that's an excellent way for him to acquire a mailing list of people who have actually sampled his goods. Each customer who is pleased with the beverage and the service will become a walking and talking advertisement for the store.

One peculiar fact about these free coupon offers is that the beneficiary almost always makes it a point to buy something else before she leaves the store, and in fact, usually before she presents the free ticket, probably out of a sense of pride and a dislike to acknowledge that she comes to the store for the sole purpose of getting something free. This being the case, the druggist can well afford to be liberal with his coupons, especially as each free drink he serves costs him only from $1\frac{1}{2}$ to $2\frac{1}{2}$ cents.

CAPITALIZING THE CROWD.

The druggist who manages things properly will reap indirect profits from the hot soda crowd larger even than the direct profits on the drinks themselves, as great as the latter is.

The experiment of placing the hot soda urns, chairs and tables in the extreme rear of the store has been tried with success. To make this pay the largest dividends, the dealer must, of course, have his sundries displayed catchily, and preferably priced in plain figures, department store fashion. The theory of the back-of-store location is to compel every patron to pass in review all merchandise, while on the way back for a drink. Of course if it is not made worth the customer's while to go so far back—if the beverage is not worth the trouble, and the added comfort and sense of freedom from hurry are not sufficient to make themselves felt—then this feature will not prove a success.

Speaking of department stores, why should not every druggist have a bargain counter in the middle of his store, filled with 5-cent, 10-cent and 15-cent bargains in soaps, corn plasters, tooth brushes, tooth powders and pastes, and a long list of other sundries such as the department stores are featuring.

While the druggist may feel that in a sense he is a professional man, he is also a merchant and must adopt modern-day merchandising methods or lose in the race. He can buy sundries just as cheap as the department stores, and he can afford to sell them on as low a profit-margin as they do, if he can sell enough of them. He can make his soda water—hot and cold—the magnet to attract the crowds; then when the crowds come, as come they will, he can tempt them with "bargains" attractively displayed. He may depend upon it, a customer who is once won will come again, and again, until she "gets the habit." I say "she" because it is the women whom he will win by this method, and they are the patrons he most wants to win, because they buy, or influence the sale of 75 per cent. of all the drugs and sundries sold in the United States or any other country.

LASTLY, AS THE PREACHER SAYS.

Before I close, let me repeat what I said in a previous article—one of the chief reasons for pushing hot sodas is to keep the cold soda department alive and active all through the winter. For that reason all that I have said about advertising and pushing hot drinks should be applied equally to your ice cold and ice cream sodas. The sale of each will stimulate the demand for both, and the trade in both will increase and multiply the business done in drugs and sundries.

Here are some of the fancy names for fountain confections found at Paterson, N. J.: "Nancy Brown," "Merry Widow," "Maiden's Dream," "Lone Star Sundae," "French Sundae," "Surprise Sundae," "Pine Cherry Sundae," "Maiden Blush Sundae," "Opera Sundae," and "National Delight."

"Are there any bacteria in this ice cream soda?" asked the summer girl. "You didn't mention them in the first place," replied the new attendant firmly. "If you're going to change your order you'll have to get another check."—A waif.

An unsatisfactory drink thrown into the sewer may cost the house 3 or 4 cents; a dissatisfied customer may cost that many dollars

Bracers for Chilly October Mornings.

Hot Gingerade.

Pour 1 ounce of ginger ale syrup into a glass; add a dash of soluble extract of ginger, and fill with boiling water.

Celery Tomato Bouillon.

This is prepared by adding a few dashes of celery extract to a cream of tomato bouillon.

Egg Cherry.

Into a mixing glass draw 2 ounces of cardinal cherry. Sweeten to taste with powdered sugar and add an egg. Shake thoroughly and strain into another glass. Fill with boiling water.

Tomato Clam Broth.

Tomato bouillon, 1 ounce; clam bouillon, 1 ounce. Draw into a hot soda mug and add a dash of cream. Season to taste and fill with hot water. Add a small piece of butter.

Manhattan Hot Punch.

Put 1 ounce of beef bouillon into a cup of hot water; season with salt, pepper and celery salt; top with whipped cream.

Hot Beef Tea.

Put $\frac{1}{2}$ a teaspoonful of beef extract into a cup; fill the cup with hot water; stir well, and add salt and pepper to suit.

Oyster Cocktail.

Six oysters; 1 ounce of clam juice; fill the mug with hot water and flavor with salt, to suit.

Hot Tomato Bouillon.

Take $\frac{1}{2}$ to 1 teaspoonful of beef extract, or about 1 ounce of good liquid beef extract, and $\frac{1}{2}$ ounce of tomato catsup, with enough hot water to fill an 8-ounce mug. Season to taste.

Tomato Cream Bouillon.

Take $\frac{1}{2}$ ounce of beef extract, $\frac{1}{4}$ ounce of tomato catsup and $\frac{1}{2}$ ounce of cream. Stir while filling with hot water and serve with spices.

Hot Pineapple Juice.

Mix about 3 parts of pineapple juice with 2 parts of hot water, and sweeten to taste. Drop a cube or two of pineapple in the mug.

Hot Orange Eggade.

Into a mug squeeze the juice from half an orange, and break an egg; add powdered sugar to taste and fill with hot water. Top with grated nutmeg.

Hot Ginger Eggade.

Into a mug draw 1 ounce of ginger syrup, and break an egg, add a few dashes of tincture of ginger and fill with hot water. A clove may be added.

Hot Ginger Cream Eggade.

Made as the foregoing with the addition of $\frac{1}{2}$ ounce of sweet cream.

Cream of Beef and Celery.

Into a large mug put 2 teaspoonfuls of liquid beef extract, and break an egg; add 1 ounce of sweet cream, and a few dashes of extract of celery. Use pepper, salt and celery salt to suit, and charge what it is worth.

As Paul Caldwell says, these new-fangled syrup pumps seem to have a fascination for the man who works them, compelling him to pump and pump and pump until his arm is too tired to proceed further. Then he serves a drink that (1) is sickening to the customer, (2) that costs the proprietor about twice what it should, and (3) that takes too much of the dispenser's time in the making.

Soda water may be made so good that people will buy it whether they need it or not. Soda sales that are confined to those who are obliged to buy have never made a fountain pay. The way to get money out of the soda business is to dispense such beverages that people are tempted to go out of their way to buy and drink them, even when they could do without and not suffer.

A soiled glass left on the soda counter cries out to the prospective customer: "The man in charge here is not neat and clean in his tastes and habits. If he allows sloppiness on top of his counter where all can see, just fancy what he must have underneath and in the back room where he makes his syrups."

Profitable Soda Business in a Poor Neighborhood.

How a Baltimore Druggist Capitalizes the Poverty of His Neighbors and Draws a Good Dividend Therefrom—Making Five-Cent Ice-Cream Soda and Sundaes Pay.

Druggists who are assailed by doubt in regard to the profitability of a soda fountain in a modest neighborhood and who have somehow gained the impression—probably from seeing elaborate and costly apparatus in many of the stores—that a large outlay for equipment and fixtures is necessary to make a fountain pay will experience a change of ideas if they happen to visit the pharmacy of Samuel Y. Harris, at Poppleton and Lombard streets, Baltimore. The neighborhood in which this store is situated is distinctly one inhabited by people of very limited means. The houses are inexpensive, and domestic economy receives a careful study in a great majority of the homes. The problem there is to make a dollar go as far as possible and to get the most for the money.

But notwithstanding these drawbacks Mr. Harris has solved the problem of making his fountain pay, and he has done this without any strong appeal to the love of the populace for show. His success is all the more interesting because of the fact that some pharmacists in the districts more remote from the business section have concluded that a soda fountain is not a profitable adjunct to a drug store, and have had such apparatus taken out. Mr. Harris' fountain is one of the rather old-fashioned variety, with marble base and fancifully carved golden buffet back. It takes up little room, being hardly larger than an ordinary buffet, and the other appurtenances are on the same modest scale. There is absolutely nothing about the place which might awe the most backward person and embarrass him with a display of magnificence. The general effect is one of plainness and simplicity which causes Mr. Harris' customers to feel that he does not consider himself above them and that he stands on their own level. This equipment not merely gains the confidence of the people of the neighborhood, but also has the advantage of being inexpensive. No large amount of money is tied up in the soda fountain and the need of earning a considerable sum to pay the interest on the investment is done away with.

Mr. Harris, furthermore, never allows himself to lose sight of the fact that the great majority of his patrons are poor, though eminently respectable and possessed of a commendable degree of independence. He knows they cannot afford to pay high prices for their soda fountain beverages; consequently he has adjusted his prices to the requirements of the neighborhood. His stand would not be one for 10-cent drinks, and he makes no attempt to get a dime for the thirst-quenchers he dispenses. Everything at the fountain is 5 cents, even ice cream soda and sundaes. But Mr. Harris has not fallen into the error of supposing that the common people "don't know any better" and that anything is good enough for them. In keeping his prices low he has avoided the expedient of trying to make profits by getting cheap materials. Mr. Harris' patrons will obtain as good a glass of soda water as can be had anywhere else. The only difference is in quantity. His sundaes are not quite as large as those served in stores that charge 10 or 15 cents, and the lump of ice cream in his glass is just a little smaller than is put in at some other stands. This is the only difference. In point of quality the customer there is just as well served as he would be in the finest establishments.

To be sure, Mr. Harris' callers do not get the trimmings, the fancy fixings and the large display to be noted in the higher-priced stores, and they do not look for them. They prefer simplicity for the reason that it accords with their mode of living and appears to them more homelike. Fancy drinks are also largely omitted there because they cannot be made satisfactorily for a small price, and the people of the locality do not call for them. Many of the customers are children, among whom ice cream soda is extremely popular.

Recreations of the very poor being few and their diversions restricted, soda water becomes to them something to be really enjoyed, and Mr. Harris' neighborhood is far more productive from the soda water standpoint

than others of greater pretensions. Even though the quantity of ice cream put into each glass is relatively small, there are days at the Harris store when more than 40 gallons of cream are served in this way, a record which few stores in Baltimore can equal. And all this trade has been built up by keeping in close touch with the people.

In a sense Mr. Harris is doing a great work as an educator. He sets an example of cleanliness and exacting care which is bound to be an example to callers. Twice a day the counter and the outside of the apparatus are carefully cleaned, and every morning the whole interior is cleansed. Glasses are washed with soda, and nothing sticky is allowed to remain on the counter after a customer has been served. There is no deviation from the rules made for keeping the apparatus in such a condition as to satisfy the most fastidious housewife. Mr. Harris himself gives this detail his supervision and he sees to it that thoroughgoing cleanliness becomes second nature with his clerks. The dispensers who have worked at the Harris store go away with the cleaning habit fixed in them.

The syrups are carefully prepared on the premises, and other fundamental detail is attended to much after the manner of other stands. All expense for advertising literature or fancy touches is cut off, for the neighborhood imposes limitations as to price, and the extras would serve no purpose other than to decrease the margin of profit.

Making Good Chocolate Syrup.

A much esteemed reader of the CIRCULAR who does not care for personal publicity in the matter, contributes to this department some remarks on the proper way to make and serve chocolate at the soda fountain. He writes: "I have sold soda in a small town for thirty years and in no single year of the thirty have I failed to increase the business in that line. Much has been printed on chocolate syrup and to this product I attribute a large part of my success in the soda business.

"The poor quality of chocolate soda found at many fountains—and good fountains, too—is astonishing, when we understand that a good chocolate syrup is easy to make and can be produced at a cost of about 55 cents per gallon. Good chocolate is a drink enjoyed by nearly every one when made and served right at the fountain. If it is featured it is a winner anywhere, I believe."

This friend then gives his formula and directions, which are as follows:

Chocolate Syrup.

Powdered cocoa.....	5 pounds.
Sugar	40 pounds.
Water	4 gallons.
Extract of vanilla.....	1 ounce.
Salt	1 ounce.

Bring the water to near the boiling point; thoroughly mix the cocoa with at least half of the sugar; pour the mixture and the balance of the sugar into the hot water and stir with a wooden spoon until all lumps are broken up; bring the syrup to a boil and keep it there for at least five minutes; add the salt and flavoring and strain at once through cheese cloth into stone jugs.

He goes on to say:

"This formula will make about eight gallons at a cost of 55 cents per gallon. If served with cream, as it should be, no gelatin, or other foam producer is necessary, as good cream containing not over 18 per cent. of butter fat, will give all the body and foam necessary to produce a perfect glass of chocolate soda.

"This syrup will keep, if necessary, a week or ten days, even in mid-summer, in any room of ordinary temperature.

"It may seem absurd to comment to any extent on so simple a product as coffee soda, but from the many remarks I have heard at my fountain, and from the product I have drank at many expensive fountains, I am led to think that this delicious beverage does not receive the attention it deserves."

Now let some other believer in a little-better-than-the-average soda come forward with suggestions as to how to serve it so.

The soda attendant who keeps a customer waiting while he polishes spoons is tottering at the upper end of a greased chute.

Cold Soda for the Cool Months.

Experts have decided that cold soda water is an all-the-year-round beverage, and those who patronize some of the more popular city fountains in winter may see for themselves that the experts are right. Perhaps suggestions for some of the reasons for this change of conditions since the earlier days of soda water may be found in the following:

Glass Sundae.

Into a large straight glass draw 1 ounce of pineapple syrup, and add a spoonful of ice cream; beat them together, fill the glass two-thirds full of carbonated water, using the coarse stream. Add a good-sized portion of ice cream on top, after the contents of the glass have been well mixed; top with crushed strawberries, and decorate with pineapple. Some dealers get 15 cents for this.

Orange Combination Sundae.

I.

In opposite sides of a sundae glass place scoops of vanilla and chocolate cream. Cover the whole with orange fruit and syrup, whipped cream and two cherries.

II

Into a sundae glass place a scoop of vanilla cream, with a small wafer or other form of pastry placed in a hollow in the center. Fill the hollow with fresh orange fruit syrup, cover with whipped cream and decorate with slices of orange.

Come Again Sundae.

Put a portion of vanilla ice cream in a sundae cup and pour over it some undiluted crushed pineapple and crushed raspberry and sprinkle with chopped walnut meats.

MalTED Milk Egg Chocolate.

Chocolate syrup, $1\frac{1}{2}$ ounces; sweet cream, 1 ounce; malted milk, 2 spoonfuls; one egg, cracked ice, enough. A small amount of ice cream may be added if desired. Shake, strain, fill the glass with water from the coarse stream; top with nutmeg.

Schoolboy's Favorite.

Into a 12-ounce glass draw $1\frac{1}{2}$ ounces of pineapple syrup, 1 ounce of grape juice and the juice of 1 lime. Add a liberal supply of fine ice and fill the glass with carbonated water. Decorate to suit the fancy.

Aviation Soda.

Into a 12-ounce glass draw 1 ounce of pineapple syrup; add 2 spoonfuls of crushed pineapple fruit, 2 spoonfuls of whipped cream, and 3 ounces of milk. Fill the glass with carbonated water from the fine stream. Top with a spoonful of vanilla ice cream and serve with a spoon.

Grape Parfait.

One ladleful of ice cream, 1 egg, 1 ounce of grape syrup, and enough chipped ice. Mix thoroughly; strain into a 12-ounce glass and fill with carbonated water from the fine stream. Sprinkle with powdered nutmeg or cinnamon.

All's Well.

Orange syrup, $\frac{1}{2}$ ounce; ginger syrup, $\frac{1}{2}$ ounce; strawberry syrup, $\frac{1}{2}$ ounce; grape syrup, $\frac{1}{2}$ ounce; acid phosphate solution, 1 dram; mint, 1 sprig; cracked ice, enough. Carbonated to fill a 12-ounce glass.

Egg Strawberry.

Into a glass drop 1 egg; add 2 ounces of strawberry syrup, 2 ounces of plain cream, and enough ice. Shake well and fill with carbonated water, using the fine stream.

Ellis, Druggist Ice Cream Manufacturer.

Frank I. Ellis, Fifty-second avenue and Madison street, [Chicago], has been manufacturing his own ice cream for the past eighteen years. He has one of the most complete plants in the city. Mr. Ellis is in a sparsely settled part of the city, but does a large business in ice cream. People come from a great distance to get his superior products.

In relating his experience to the writer, Mr. Ellis stated that the public wanted good wholesome ice cream made from cream, sugar and flavoring and were willing to pay for same. He retails his cream at 40 cents per quart. On Sundays and holidays he has special flavored and fruit creams for which he gets 50 cents per quart.

This demonstrates that any druggist can make money out of the ice cream business.—C. R. D. A. Notes.

Serving Hot Drinks.

The increasing popularity of hot drinks at the soda fountain, says J. Hungerford Smith, has not only opened up a new field of profit for the dispenser, but has also enabled many dealers to make their soda-water business a year round proposition, the increased sale of cold soda alone proving an attractive consideration.

Instead of your soda fountain lying idle all winter, an item of expense, make it a profit paying investment and a source of constant and satisfactory income.

An engine which is in constant use can be operated with greater economy than one which is in use only part of the time, and the same is true of the soda fountain. In the larger cities many fountains make a profitable feature of the hot soda lunch, which is becoming more and more popular with professional people, business men, students and others.

Hot egg chocolate, and other egg drinks, and clam, chicken and tomato bouillons are favorite specialties for this trade. These should be served with saltines, graham or soda biscuits, or wafers.

Money in Hot Soda.

Someone has figured out the profit on \$25 worth of hot soda as equivalent to that on \$100 worth of the cold beverages. The initial cost of a hot-soda outfit is less than one-tenth—say one-twenty-fifth—of that of a cold-soda fountain and accessories.

The presence of a hot-soda urn frequently attracts people to the cold-soda fountain in winter when they would not come in but for it. For instance, two people are passing a drug store. One says: "Come in and have a glass of ice-cream soda." The other replies: "Oh, it's too cold for ice-cream soda." "Well, take something hot, then," and they both go in, one indulging in the cold and one in the hot drink.

This is no fancy picture, but something that happens every day in the winter.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,

William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

	3 months.	6 months.	12 months.

Card $2\frac{1}{2} \times \frac{1}{2}$ inches.....	11	19	33

Special prices are charged for preferred positions.

Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

NO ORDER GIVEN TO ANY REPRESENTATIVE OF THIS PAPER BECOMES BINDING UNTIL APPROVED BY ITS MANAGER.

QUESTIONABLE OR UNDESIRABLE ADVERTISEMENTS WILL NOT BE ACCEPTED.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER II.

NEW YORK, NOVEMBER, 1911.

WHOLE NUMBER 659.

Working Tools of the Craft.

How much pleasanter it would be all around if we could discuss only the joys and beauties of the drug business, and could forget the long hours, the hard work, the dead beats, the excessive rents, the high wages, the extortionate express charges, the dispensing physicians, the tales of woe and hard luck on the part of the sick and indigent, the adulterated goods, the fakes, the breakage, the indifference and wastefulness of clerks, the unreasonableness of customers, the bore who tells over and over again the funny story about the plasters with the holes in them, and the hundred—yes, thousand—and one other things which go to prevent the druggist's life from being a bed of roses. We say, what a pleasure it would be to conduct a drug business free from these things and reminders of these things, yet abounding in beautiful fixtures, prettily arranged bottles, bright lights, sweet odors, charming customers, interesting and profitable prescriptions, a steady demand for goods in stock, attentive and contented clerks, delightful days "off," and an even run of trade throughout all the hours of the day.

It seems a shame to wake a man up out of a sleep in which he can dream of these things, and rude to dispel the smile which lingers at thoughts of them by pointing out his faults and shortcomings, but we are not in fairyland where the waving of a wand will bring about desired changes, and the drug business is one in which its devotees still have to work and worry, so some of the unpleasant things have to be endured, and frequently are discussed. It is with a desire to lessen their work and relieve them of much of their worry that we direct the thought of certain druggists to a matter which we fear does not receive as much of their attention as it might with profit to the druggists themselves—the matter of proper equipment.

We were reminded of this subject by the paper read by J. O. Burge at the recent meeting of the Tennessee Pharmaceutical Association, which paper (see the CIRCULAR for September, page 466) reminded us of a previous one by Dr. H. P. Hynson, mention of which was made in connection with Mr. Burge's article, and also calls to mind one on books, by H. D. Morgan, commented upon editorially in the issue for last March, page 119, and another on journals by M. I. Wilbert, printed in the CIRCULAR for December, 1907, page 783. We fervently wish that every retail druggist in America would get all these articles to-

gether and read, re-read, mark, learn and inwardly digest them, to the end that such of them as need to might come to a realization of the way in which they are handicapping themselves, losing time, trade and money, provoking profanity, setting a bad example to their clerks and in various other ways acting in a short-sighted and unreasonable manner by not providing themselves with a fairly full assortment of the working tools of their craft, including books and journals. Would that we could sing it out so loud that all could hear, and so clear that none could misunderstand, and so feelingly that everyone who heard and understood would heed, that the druggist who tries to do business with one old pair of prescription balances, a drawer half stocked with more-or-less inaccurate weights, a few broken-footed and chipped-lipped graduates, and the rest of his woefully inadequate supply of working utensils about on a par with these, is doing himself as great an injustice as would be the farmer who tried to work a two-hundred-acre farm with a brindle bull yearling, or a ditcher who undertook to do piece work with no implement other than a kitchen spoon.

Glassware costs but little and a few extra graduates would pay for themselves in time saved when the one graduate needed is smeared with copaiba and the other one (which could possibly be made to do) is in use by the clerk downstairs. An old balance, with weights that have worn too light or have become gummed and too heavy, may cost more in the shape of a fine for an erroneously prepared mixture than enough to pay for two new pairs of scales and sets of weights—and, oh, the pure joy of having good things and plenty of them when they are wanted; and the renewed pride they give one in his work; and the value they are as an advertisement, both to physicians and the public. Test tubes, percolators, beakers, mortars, filter stands, retorts, stills and the like not only are the handiest things a chemist and druggist can have around his shop, but if a suitable combination of them in action is set in his display window now and then, they will do much toward paying for themselves in the awe which they will inspire in the passing multitude.

The dispensing pharmacist who tries to economize by using his fifteen-year-old dispensatory and getting his National Formulary recipes out of the back of a book which does not give the formulas of the latest edition and gives such as it does contain in a lame and unsatisfactory manner, is saving at the

spigot and losing at the bung. And while we are on the subject of reading matter it might as well be said that so important to every merchant and professional man are the journals devoted to his particular vocation that the druggist who is too busy to read them would probably be busy enough and save money enough to justify him in hiring another clerk if he only would glean some of the trade-bringing and money-making and time-saving ideas from a few of the leading publications edited in his interest—and with an extra clerk, he might find more time to devote to his journals and a few extra hours a week in which to become personally acquainted with the members of his family.

The druggist who does not subscribe for a good journal, or does not look over it carefully when it comes, or does not seize upon some of the suggestions which it contains and turn them to his profit, belongs in a century that has passed never to return. And the man who reads his journals and throws them aside, when it is so easy to string them together and keep them and their indexes in place for future reference, does not realize more than half their value.

Men and brethren, look around you. Do you feel that what we have herein said, or any of it, applies to you. If you do, take it as a personal dig; "get mad" if you like—as a man who is aroused to anger generally does something—yes, get mad, and just to show that you are not the kind of "has-been-ers" or "never-was-ers," "or can't-be-ers" that would be guilty of such short-sighted penny-wisdom and pound-foolishness as we have in mind, but can not appropriately describe, pry yourselves loose from a ten dollar bill this month, and about two dollars a month more for the next twelve, and see if you can not see a compensatory difference in your daily receipts and night's rest.

Necessity for State Regulation of Food and Drugs Traffic.

While the United States government is in many respects one of the strongest in existence, like all things human it has its limitations. Some of these limitations of a constitutional nature are not quite so well defined now as our grandfathers thought they were, but others have never been questioned. While it frequently has been stated that the president of the United States has greater authority in his country than the king of Great Britain has in his, it is nevertheless true that the president has no more authority in matters concerning the internal affairs of any State than has a private citizen. And by the same token, congress has no more authority to enact laws affecting the internal government of a State than has the law-making body of some other State or of some foreign country. In other words, each State is theoretically a sovereignty in itself with respect to all matters not specifically yielded by that State to the general government as set down in the constitution of the United States. Among their rights which the

States have yielded to congress are, the right to provide for the defense of the United States, the right to coin money, the right to regulate interstate and foreign commerce, the right to establish post-offices and post roads, and the right to issue patents.

The States have never granted to congress the right to regulate the purity of their food and drug supplies—and just here a good deal of confusion seems to exist in the minds of many of our fellow citizens, including druggists. A natural question is: How can congress enact, and one of its co-ordinate branches of the government execute, and another co-ordinate branch pass judgment upon a food and drugs act, if the general government has no authority in such matters? Those who ask such a question may find its answer in the text of the food and drugs act itself. The full title of the statute is, "An act for preventing the manufacture, sale or transportation of adulterated or misbranded or poisonous or deleterious foods, drugs, medicines and liquors, and for regulating traffic therein, and for other purposes." That portion of the law which refers to the manufacture or sale of food and drugs does not apply to the several States at all, but prohibits such manufacture or sale in any Territory or the District of Columbia. Congress can not, and does not attempt to, prohibit the manufacture or sale of adulterated, misbranded, poisonous or deleterious food and drugs in the several States, but it does prohibit, and under the provision of the constitution granting it the right to regulate traffic between the States has a legal right to prohibit the shipping of such goods from one State to another. In a case in which a manufacturer in one State has been arrested by United States government officers on account of having delivered to a dealer in another State an adulterated drug, the offense of the manufacturer in the eyes of the law is not the adulteration of which he has been guilty, but the shipping of the adulterated goods across the State border. Unless it can be shown that the goods in question crossed the line dividing the two States, no punishment can be meted out by the United States to the adulterator. The manufacturer is innocent under the law up to the moment the carrier bearing the adulterated drug crosses the State line. Of course, when the District of Columbia, a Territory, or an importation from or an exportation to a foreign country is involved, the case assumes a different aspect.

We have gone into this matter somewhat in detail in order to make as emphatic as possible the point which we wish to bring out, namely, the necessity not only for State food and drugs laws, but the necessity for their enforcement, if we are to stamp out the manufacture and sale of adulterated, misbranded, poisonous or deleterious foods, drugs and beverages in this country. United States officials acting under the food and drugs law may prevent the importation or interstate shipping of ground belladonna root containing fifty per cent. of ground olive pits, but they can not prevent ground belladonna root and ground olive pits, in separate packages, from going to the same dealer, nor can they prevent the dealer from mixing

them and selling them as pure belladonna root anywhere within the State in which the mixing is done..

Most of, if not all, the States have laws prohibiting adulteration of food and drugs, but in only a few of them, seemingly, are these laws so executed as to cause any great amount of anxiety on the part of those who profit by the adulteration. In some States excellent work to protect the stomachs of citizens is being done by food and dairy commissions, boards of health, boards of pharmacy and other agencies of a similar nature. It is to these agencies that we must look for a correction of many of the abuses found in places in which food, drugs, confectionery and beverages are manufactured, sold or served. The United States government, with all its power, can not go into the shipping room of the local jobber, or behind the soda counter or into the manufacturing department of the confectioner, or inspect the restaurant kitchen; but local boards of health can do these things, as can also State departments entrusted with the regulation of such matters, and these should be urged to do their full duty, to the end that true pharmacy and all honest dealers may come into their own.

Our Price List Supplement.

"It is the intention of the publisher to make THE DRUGGISTS CIRCULAR price list the most complete book of the class ever issued." These are the first words in the introductory to the first issue of the Red Book, published in March, 1897. Since that time the list has been revised two or three times each year, each time with a view to making it of greater service to our readers. Not only have the original features of the supplement been amplified, but new ones have been added from time to time. Thus, when the stamp tax was imposed on account of the little good-natured fracas we had with Spain, schedules of the things taxed were printed as part of the Red Book during several issues in 1898 and the next two years until the tax law was repealed. The food and drugs act was passed in 1906, and its text has appeared in many issues of our price list. In various numbers various other matter to which druggists may at any time wish to refer quickly has appeared. When the book was still in its infancy there was incorporated in it the old Rebate List prepared jointly by the National Wholesale Druggists' Association and the Proprietary Association of America. To make this feature more valuable we devised a system of numbering the names of the proprietors and attaching corresponding numbers to the names of their preparations listed in the body of the book. This system of reference proved such a great convenience to users of the list that we have now so extended it as to make it apply to all known manufacturers of proprietary medicines. In order to do this without making the system too cumbrous, we have combined with the numerical reference an alphabetical one, the combination making easier a quick reference from the name of the article in the list to the name and address of its manufacturer.

As usual, the changes in prices in this edition of our price list have been numerous, and many new

articles are quoted. Indeed, it might be said that the list has practically been re-written, so great have been the changes made in it. No list of this kind can be complete and perfect until such time as new drugs cease to appear and prices on old ones do not vary with time and locality. By frequent revisions, however, our list is kept reasonably up to date, and between its semi-annual revisions we chronicle in our regular issues any change in prices which may be of especial interest to our readers.

The current number of the Red Book, published as Part II of this issue of the CIRCULAR, represents an amount of labor and care that no one who has not been through the experience of preparing such a list can comprehend. But we keep constantly in mind the principle, above quoted, enunciated when we first issued this supplement to the CIRCULAR, and intend to let no trouble or expense prevent us from giving our readers what two or three generations of them have been looking to us to provide—the best of everything in our line.

That Hackneyed Old Subject—Advertising.

Advertising has been harped upon so insistently by those who know something about it and those who have caught up the cry parrot-like, by those who are actuated by self-interest and those who simply want to fill space, by those who have tried advertising and know its value and those who have put their money into ill-advised advertising campaigns and lost it, that it might seem that there would be nothing more to say on the subject and nobody left who has not reached his conclusion in the matter.

But advertising is a live force, and new things are discovered about it every day. It is like electricity in that it is put to uses now which had never been thought of in connection with it a dozen years ago. Business writers can no more exhaust the subject of advertising and stop than poets can sing all there is to be sung about women's beauty and charm, and hang their harps on the willows as being of no further use in this connection.

Advertising has been referred to as a subtle force: it is all that, and more. No one can tell when an advertisement is launched where its ultimate stopping place will be and how many ports it will enter on its voyage.

An advertisement is like a wireless telegram, in that it is directed to a certain station but may be "picked up" and answered by any station within reach of the electric waves—and the waves extend in every direction.

In spite of all that has been said about advertising, especially druggists' advertising, there are yet druggists who pay for newspaper space, fill it with stereotyped phrases which were dead when born and have been disintegrating ever since, and fondly lay the unction to their souls that they are exponents of the art of gaining desirable business publicity through printers' ink. There are still so-called business men who have been goaded into the belief that they must advertise in the papers, who set forth the fact that

they offer for sale some seasonable specialty adapted to the days of frost and snow, and neglect to change the "copy" until the months have rounded out their cycle. Doubtless there are among these men a goodly proportion of those who hold that advertising does not pay. Rather should they say that some kinds of advertising does not pay.

Stiff, formal, high-flown language is out of place in the advertising space of the retail druggist. The stiff and formal kind may do for notices of esoteric books, and the high-flown is adapted to use on circus posters. Smart quips may please the man who originates them and flatter his vanity when they appear in print, but unless they are something more than just that, they are poor advertising. Many people resent undue familiarity manifested by such salutations as "Hi, there, old top, come in and buy a tooth brush and sweeten your breath," and advertising of a similar flavor does not induce them to patronize the store which puts it forth. There is just as much opportunity to fall into error in preparing advertising copy by trying to be smart as there is by being dull and commonplace, and a chance of giving offense to more people.

The best advertising is that which embodies in short, clean-cut sentences the sincere expressions of a man who is familiar with the merits of the goods offered; and the goods offered should be at least reasonably seasonable—not men's straw hats in December nor Christmas cards on the Fourth of July. The man who believes in himself and in his wares, who knows his clientele, who is sincere and direct in his statements and has an ability to put his thoughts into readable English, and will give the subject the care and attention to which its importance entitles it, needs no "expert" to tell him how to prepare his advertising copy: his own ideas and language are more convincing than any he can buy of a man at a distance, although many valuable suggestions may be obtained from those who have made a special study of the science and art of gaining publicity.

To test the power of advertising, let any druggist look around his store and select some line of goods that is not moving as fast as it should. Then let him turn over in his mind what he would say to a customer to whom he wished to sell some of this line. Let him set down on paper all the strongest arguments in favor of the goods, arrange these in logical, systematic order, put them in short expressive sentences, take the copy to his daily or weekly newspaper office, get one of the men there to go over it with him and make suggestions for its improvement, act on such of these suggestions as appeal to him as being valuable, and have the advertisement set in attractive, distinctive and not overcrowded style and inserted in a conspicuous portion of the paper. At the same time let him make a window display of the goods, arrange the stock in a prominent place in the store, show some neat hangers calling attention to them, and instruct the clerks to offer an unobtrusive word about the goods to casual droppers-in; at the end of a couple of days or so, in the case of a daily paper, or in each issue of a weekly or semi-weekly,

let him change the wording of his advertisement. Then, in the course of a fortnight, if he does not find that the goods move faster than they did, it will have to be admitted that good advertising of the ordinary kind does not pay him. Of course, there are still other ways in which the newspaper advertising may be made more effective. For instance, typewritten slips calling attention to the goods may be enclosed in packages leaving the store; circulars may be mailed to a selected list of prospective purchasers; dodgers may be handed out to those who pass by. Methods which are applicable in some cases might be entirely out of place in others. When the experimenter has hit upon the right combination, he should not stop, but rather press forward more persistently than ever, laying out for a whole season in advance his "system" of publicity promotion.

Advertising is cumulative in its effect. An advertising campaign for nursing bottles this year makes easier and more efficacious a similar campaign next year in the interest of perfumes or shaving brushes or any other line entirely foreign to the first one.

That the right kind of advertising pays is a proposition so evident that argument in support of it is unnecessary and uncalled for. If any proof of its truth were needed, one need but point to the fortunes which have been made out of businesses which without advertising would never have amounted to a row of pins.

WHAT'S THE USE OF BEING SICK, ladies and gents? Walk right up here and get your medicines for all ills and at prices so low that none need suffer. Here's your Blaud's pills, one hundred in a bottle, for only six cents, your dollar bottle of dandy hair renovator for fifty-five cents, your pound bottle of "peroxide" for fourteen cents, your Pidia Linkham for all woman's ills for sixty-three cents, your Puffy's walt, guaranteed to make you live a hundred years, for sixty-nine cents, four ounces of essence of pepsin, a sure cure for all digestive troubles, for fifteen cents, Catcher's pitchoveryou, the kind that has always made the baby cry, for nineteen cents, and sulphur, salts, syrups of hypophosphites and elixirs of strychnine at prices never before heard of. Come along, don't be afraid, the matchless dry-goods and house-furnishing house of Seenher-Giggle is behind every sale, and if you persist in suffering the ills of the flesh when such an unrivalled array of sure cures and infallible remedies is at your service, you have only yourself to blame. Come along and buy 'em anyhow, while they are cheap, for if you are not sick now you never can tell what may happen before to-morrow, and it is well to be prepared with mepto-pangan, repuna, and pine syrup for any emergency. All you have to do is name your trouble, select a remedy to fit, pay your check at the desk, and get your trading stamps. (Is it any wonder that drugless therapy is gaining recruits when drugs are advertised like remnants of dry goods, to create a bargain rush—drugs to be poured into the human body, the most delicate and wonderful piece of mechanism in existence, and one about whose intricate workings but little is known?)

BOUND VOLUMES OF THE CIRCULAR are to be found in many drug stores throughout the length and

breadth of the land. Occasionally we receive a letter from an old subscriber to the effect that he has complete files of the CIRCULAR and would feel lost without them. Not a month passes that we do not get an urgent request for a formula or something of the kind, when the inquirer could have saved himself the trouble and expense of writing, and the time he had to wait, and the loss growing out of inability to supply the customer with what he wanted, or the bad impression made on the physician by evidence of unpreparedness, simply by having at hand the copy of the CIRCULAR containing the information. We have the copies on hand, held together by the binders which we supply, and the annual index to each volume bound in with it. By referring to the annual indexes extending back over a period of three or four years, we can find answers to a large percentage of the queries we receive. We believe that most of our readers keep their copies for future reference, but evidently there are still some failing to do this who could begin it now with profit. It is not even necessary to buy the binders, although they are well worth the price we ask, as with an awl, a large needle, a piece of twine and a sheet of heavy manila paper any boy can bind twelve copies of the CIRCULAR in such a way that they will not become lost, torn, soiled or disarranged so easily as if left loose on the shelves. We do not mind supplying the information, but we dislike to see our readers inconvenienced as noted when the way not to be is so easy. Suppose we did not keep our reference files!

IN COLORADO there are fifty members of the American Pharmaceutical Association, that is, using the Proceedings for 1910 as a guide and counting Charles M. Ford as only one man. Maybe there have been some accessions to the membership from the Centennial State during the past year, and maybe Mr. Ford—but never mind that for the present. In the five States and one Territory bordering Colorado, there are—still basing our figures on the latest available statistics—one hundred and twenty-one members of the association, distributed as follows: Nebraska, thirty-six; Kansas, thirty-one; Utah, twenty-four; Oklahoma, twenty-two; New Mexico, five; and Wyoming, three. By adding the three members in Arizona, which touches corners with Colorado, we find that in this entire group of States there are one hundred and seventy-four members. Considering the relatively small population of this group of States and their comparative remoteness from the older portions of the country and the center of population, this is not a bad showing. South Carolina, one of the original thirteen States, with a greater population than Colorado, Utah and Wyoming combined, has only four members of the association, to the seventy-seven of the other States named. After the meeting to be held at Denver next year, doubtless the Rocky Mountain States will make even a better showing than they did when the 1910 statistics were prepared.

ALL DRUG CLERKS ARE NOT AS BAD as the results of their efforts seem to indicate. Many a young man has the best intentions and would do as well as he means if he only had a little of the right kind of instruction. A clerk may have learned a method of filling a prescription, or of making a stock preparation, or of arranging goods, or of waiting on customers in one store, which is not at all the way the proprietor of the next store in which he works would

have him perform a similar task. Is it the fault of the clerk or of the proprietor when the former acts contrary to the latter's wishes, when the proprietor has not informed him what those wishes are and shown him how they may be complied with? Habit is strong in most people, and a clerk who has been in the habit of doing a certain kind of work in a certain way for a year or two, will doubtless lapse back into that way of doing it in more than one unguarded moment before he has become accustomed to a new way. Just as it is not the fault of children when they behave ill in public, but a reflection on their parents, so in many cases is the clerk who does a thing wrong less to blame for his shortcoming than is the more experienced man who with diligence and patience should have shown him the right way. When a clerk can not or will not learn, or when he does wrong intentionally, we believe his employer will know how to proceed without any suggestion from us.

SIXTEEN SETS OF LABELS is what one manufacturer claims he has to have on hand in order to label his goods so that they will comply with the laws of the various States into which he ships them. We doubt this. We believe that it might have been the truth if he had stated that in order not to tell something in one State which the laws of another require him to state on his labels, he used different labels for these States. If he used the same label in the less exacting State that he uses in the more exacting one, we believe the officers of the former would not molest him. If he prefers to state certain facts in only those States which require him to, and keep his customers in other States in ignorance of them, then he has a legal right to use different labels for the goods going into different States, but we do not believe the laws of the various States require him to do this. All the food and drugs acts require a certain amount of truthfulness in the labels, some more and some less. A good way to keep from having to use so many different kinds of labels is to have one label which tells all the truth that all the States require. We believe that those who insist upon using sixteen different kinds need blame only their desire to hide from the users of their goods in one State something which by law they are required to reveal to those in others.

WHEN THE FOOD AND DRUGS ACT was passed, a paragrapher on the staff of a New York evening newspaper wrote: "The idea that the trust, rebate and pure food legislation as passed amounts to anything will be found to be largely a huge joke—as big a joke as the interstate commerce commission or the civil service law—mere bugaboos to impress suckers and scare easy marks; sound and fury, signifying nothing." Of which prediction so much as refers to food legislation has been knocked into a cocked hat by one man—the man whom so many of the food and drug adulterators and misbranders have been trying (ineffectually, be it said with praise and thanksgiving) to get out of the bureau of chemistry of the federal department of agriculture.

There will never be an approximation to a settlement of the differences between doctor and druggist, and correction of abuses, until pharmacy is restored to its proper place as an integral department of medicine—until the pharmacist works hand and hand with the physician.—*American Journal of Clinical Medicine*.

Proposed Permanent National Conference on Drug Legislation.

When, as chairman of the legislative committee of the American Pharmaceutical Association, Dr. H. P. Hynson, of Baltimore, went before the ways and means committee of the house of representatives at Washington at the last regular session of congress to present an argument in favor of the Foster anti-narcotic bill, he met, bent on the same errand, representatives of the retailers, the wholesalers, the manufacturers and the men engaged in what might be termed the scientific aspects of pharmacy, and the views expressed at the congressional hearings by these several representatives were almost as varied as the interests they represented. Of individual opinions there were many and they showed a great divergence of aim and import, with the result that the ways and means committee was not strongly impressed by the force of those druggists behind the bill. This scattering of fire by men who should work together to gain a common end, Dr. Hynson regards as one of the most serious obstacles to obtaining proper pharmacy legislation, either from congress or from any of the State legislatures. As long as it continues, he believes, it will be difficult, if not impossible, to imbue lawmakers with the conviction that the demands of the druggists of the country are entitled to serious consideration.

The subject, according to Dr. Hynson, far exceeds in importance the personal preferences of individuals or even the preferences of separate divisions of the drug trade. He holds that there is bound to be legislation regulating the drug trade, restricting the sale of articles and fixing standards of purity or strength, and that if the druggists cannot get together and themselves aid in determining these regulations and fixing these standards, the general public will do it for them as a matter of self-protection. In this situation, Dr. Hynson points out, the regulating and restricting may be done in a way not at all to the liking, or consistent with reasonable regard for the rights, of the pharmacists of the country. Dr. Hynson, consequently, argues that it behooves all the divisions of the drug trade to take a broad view of the subject, a view far beyond the mere individual concerns, and to agree upon legislative programs which shall have the entire profession and the business interests of pharmacy behind them.

To this end he suggests that all the druggists' organizations name delegates to a national conference at which the legislative proposals offered can be thoughtfully discussed and measures formulated which shall be certain to get united support. Of course, he says, all purely personal considerations must give way to the great common object sought. He emphatically declares that it is not what the retailers may want, what the wholesalers may desire, or what the manufacturing chemists or the makers of proprietaries may prefer, but what is for the good of pharmacy as a whole that must receive endorsement. And if the druggists go before congress or a State legislature with a program based on this principle, they will receive respectful attention and come very near getting what they want.

At present the manufacturers have their association, the retailers their national organization, the manufacturers of proprietaries their big central body, each aggregation working for objects designed to

benefit its membership irrespective of other branches of the business. Clearly, in the opinion of Dr. Hynson, neither of these organizations is in a position to undertake the work in question. It follows, therefore, he says, that the American Pharmaceutical Association, embracing in its membership all the divisions mentioned, and made up of all shades of opinion, is best qualified to serve as the society under whose auspices the mapping out of a program of the character indicated is to be done. Dr. Hynson's experience as chairman of the American Pharmaceutical Association's committee on national legislation has led him to the belief that the legislative problem can be attacked successfully only in some such way as here suggested, and he holds, furthermore, that druggists will be standing in their own light if they neglect to adopt some means of crystallizing sentiment in their own ranks and getting close together on the matters in behalf of which they would claim the attention of congress. He maintains there is positive danger in failure to take such a course, for the public will proceed, sooner or later, to take the question of legislation on drugs into their own hands, with results that may do great injury to pharmacy as a business and as a profession as well.

At the meeting of the American Pharmaceutical Association held at Boston in August Dr. Hynson gave expression to some of his ideas on this subject, as is reported in the CIRCULAR for September, page 514. Other members of the association thought it best to let the conference, when it was called, be a free agent to organize itself and work as its members saw fit, and not under direction from the American Pharmaceutical Association. The matter was referred to the association's council.

Just here it is appropriate to note that in this State local associations of druggists in Brooklyn, in Manhattan, in Buffalo, in Syracuse, and in other portions of the State formerly sent representatives to Albany to ask for legislation and frequently the efforts of a delegation from an association nullified the efforts of a delegation from some other association, although, perhaps, what would have been good for one would have been good for all. Once in disgust the chairman of a hearing dismissed the clamoring druggists, bidding them go out and agree upon what they wanted, and when they had done this to come back and let the committee know.

It will be recalled by many that at the invitation of the legislative committee of the American Pharmaceutical Association there was held at Chicago several years ago (see the CIRCULAR for February, 1906, page 68) a conference of representatives of the American Pharmaceutical Association, the National Association of Retail Druggists, the National Wholesale Druggists' Association, and the Proprietary Association of America for the purpose of preparing a model anti-narcotic bill. This is a precedent for the organization of just such a conference as Dr. Hynson proposes.

The Blackwell (Okla.) *News* for August 24th, 1911, contained an advertisement, a portion of which consisted of a testimonial from Mrs. Charles Butcher, of that city, to the virtues of Doan's kidney pills. As a matter of fact this very Mrs. Butcher had been dead nearly two months before the advertisement appeared; and she died of kidney disease!

Pushing Home-Made Specialties.

By J. C. DILLS, DRUG CLERK.

In our establishment there is no need, desire, tendency or temptation to substitute our own-made goods for the advertised specialties of the manufacturing pharmacists and physicians' supply houses. We knock the proprietary and pharmaceutical bluff out of the box by having a talk with the various physicians in our vicinity and showing them that if they have confidence enough in us to allow us to compound many of the mixtures that they daily prescribe, they also ought to have enough to allow us to make dozens of the preparations that are as easily put up as any common prescription. All of them from whom we get any worth-while amount of business are now boosters for our pharmaceuticals. We have about thirty preparations that stand between our physicians and any desire they might have to prescribe those of wholesale manufacturers. They are not made up to imitate the color or taste of any other preparation and are prescribed under names of our own. The results have been satisfactory to us and to the physicians.

We have "sampled" and "detailed" the physicians, just as do our competitors, and have several of our own original medicines going well. We guarantee that our own-make articles contain exactly what the label claims and nothing else. Our elixir of iron, quinine and strychnine phosphates, U. S. P., is just that; it is not doctored up with potassium citrate or other junk. Furthermore, we do not claim that our compound solution of sodium phosphate with iron contains tincture of iron chloride, and on the same label claim that the amount of alcohol present is x per cent., the said percentage being so low that one statement or the other is necessarily untrue. Neither do we bolster up our cascara preparations with phenolphthalein or podophyllin; and any cough mixture of ours that contains 2 grains per ounce of red spruce gum contains it in a form sufficiently soluble to be detected by taste. Our expectorant with bromoform is stable, in spite of stories to the contrary circulated among our physicians, and, further, the bromoform may be detected by smell and taste, and will in over doses give the bromide rash, which the preparations of some others have failed to do.

We do not sneak up to the doctor's office, leave a few samples and sneak away again, but *take* them up and *talk* them up. We have induced the doctors to use many of our capsules instead of manufacturers' compressed tablets, on account of the greater solubility of our goods.

The lazy man and the man with no confidence in himself are the ones that are the most pernicious and persistent substitutors. We do not substitute. Any physician that writes for Bill's pap tablets gets Bill's when we fill the order, although we may be of the opinion that they are poor truck.

We make our own tablet triturates of morphine, codeine, and heroine, and all other costly tablet triturates, for we have found that on top of the 50 cent charges for making blanks, one who buys this class of goods must pay a fancy price for the drug. Codeine is listed at about \$6 an ounce; $\frac{1}{8}$ grain codeine tablets are listed at \$4.70 per thousand, less a small discount which makes them cost, net, about \$4. In 1000 tablets containing $\frac{1}{8}$ grain of codeine each there are 125 grains of the drug, which quantity, at the rate

of \$6 an ounce, is worth \$1.71. Allowing 50 cents a thousand for making the tablets, we find that we should pay \$2.21 per thousand for tablets for which the manufacturers charge \$4. By doing our own manufacturing we save the difference—\$1.75 on each thousand tablets. A cough syrup that we had to buy cost us \$4 per gallon in 5-gallon lots. We make 5 gallons of it for \$11, plus the cost of the labor, which is about 50 cents.

Pharmaceutical manufacturing is very interesting and profitable employment for us clerks to be at instead of getting stagnated by leaning on the counter or cases, or looking moon-faced because we are not treated as other clerks are.

What a lot of clerks need is enthusiasm, and when one gets that he sometimes begrudges the time it takes for him to go to his meals when he is not quite through with some proposition that is a "sticker." I always imagined that I hated the drug business until I tried some others, and found out that they all have something in them that is not a bed of roses.

Intra-State Drug Inspection.*

By CHARLES M. FORD.

The forces of the Colorado State Board of Health have for several months been engaged in safeguarding the public against adulterated and unwholesome foods, and unsanitary conditions incident to the summer season.

WHAT THE BOARD OF HEALTH IS DOING.

With the passing of warm weather it is the board's intention to learn fully the character of the drugs and medicines furnished to the people of Colorado and to inspect the establishments wherein this service is rendered.

Not only must we drive adulterated and misbranded drugs from the markets of our State, but we must see that the pharmacist performs his part in a skilful and workmanlike manner.

The most serious form of adulteration in drugs and medicines is that which results from the unskilful, slovenly and unclean manipulation on the part of the dispenser.

DIRT IN DRUG STORES.

This form of adulteration caused by filthy stores and utensils goes unchecked largely because it does not come under the public eye and because of the smaller quantity relatively of drugs that are consumed as compared with foods.

Imagine a dairy or food factory kept like some of you keep your laboratories.

CLEANLINESS AT SODA FOUNTAINS.

In behalf of the pharmacist, it must be said that his beverage department, that is, where the soda fountain is located, is in a sanitary and inviting condition in nearly all stores. This is fortunate, in view of the larger quantity one takes as a beverage than as a medicine.

It would be well if "citrate of magnesia" could be classed with the beverages and thus dispensed clean. In making this preparation, we should bear in mind that the patient takes 96 spoonfuls in one gulp. If this has passed through the wedgewood mortar, which holds in its pores the remnants of hundreds of opera-

* An address delivered before the Denver Pharmaceutical Association, September, 1911, and contributed by the author.

tions, is further contaminated by some imperfectly glazed or galvanized vessel, and then filtered in the balmy atmosphere of the shop, Omniscience only knows what it may contain in addition to what is required by the United States Pharmacopœia.

VALUE OF THE FEDERAL FOOD AND DRUGS ACT.

While in attendance upon the annual convention of the American Pharmaceutical Association at Boston last month I came in contact with a number of persons engaged in the food and drug service of several States, visited a few State departments and the National Bureau of Chemistry at Washington. I take pleasure in reiterating what has so tersely been said by others, that the greatest piece of legislation ever enacted by congress was the food and drugs law of June 30th, 1906, and that departments operating under that law comprise the most useful and beneficial branch of our national government. In comparison, the army and navy are but a means to pleasurable exercise and pastime and to furnish respectable occupation for sons of the idle rich.

POOR INSPECTION OF DRUG STORES.

It would be unfair to judge of all the States in the Union from what I have observed in the few States my limited leave of absence permitted me to visit. But if I should venture an opinion it would be that the real inspection of drug stores within the States has not yet begun. A pretended inspection consists in having an inspector purchase a sample of tincture of iodine or lime water to be analyzed or assayed rather, by the State chemist. The inspector that procures the sample is not a pharmacist, and may not be even able to spell the name of the article he is sent for. Iodine and lime water are chosen because the determination is easy and might be done by a mere tyro in pharmacy. Such inspection is only a farce and might better never be attempted. Inspection of drug stores can be made only by a pharmacist and must not be confined to those articles for which assay processes are given in the United States Pharmacopœia. Those preparations which can not be standardized and which are more or less perishable are what require the services of a skilled inspector.

Condition of premises and merchandise, equipment and methods of dispensing and compounding are all factors for determining whether or not adulteration and misbranding are present.

COMMERCIAL GRADES NOT FOR TRUE PHARMACY.

A large number of Denver stores use the commercial grade of alcohol exclusively. Some carry the commercial and U. S. P. grades both; and quite a considerable number carry only the U. S. P. quality. For all the uses for which alcohol is sold to the public, the commercial grade is sufficient. But when the fact is considered that there is but a few cents difference in the gallon price and that the U. S. P. grade is two degrees higher proof, should not the better quality be carried exclusively by all drug stores and an appropriate label affixed setting forth its high grade? For making elixirs, flavoring extracts, toilet preparations, etc., the commercial grade should never be used.

A number of substances of commercial grade, other than alcohol, are being handled by the jobbers and find their way into the stores of pharmacists. A few of these, such as the mineral acids, ammonia water, permanganate of potassium, and others, are really

used for technical purposes and in the arts, and may therefore properly find a place in your stocks. But the majority of them are known to have no commercial use whatever, and are branded as commercial, technical, regular or in such other way as to evade the application of the law, and to tempt you by a less price. Any firm, no matter what its reputation, that will market this class of goods, knowing well that they are for the drug trade, must be viewed with suspicion.

SOME ARTICLES MAY BE TOO GOOD.

Be on your guard also against any firm that offers to furnish a quality superior to that of the U. S. P. They don't have to do it. An official article that is superior to the U. S. P. is misbranded under the law of this State. An analysis would probably show that it was adulterated.

KEEPING POISON.

It is surprising the number of druggists that do not see the importance of segregating the poisons in their prescription case. It would seem that convenience, if no other consideration, would suggest that they be kept in a compartment by themselves.

DISPENSARY TABLETS.

The most objectionable thing found in any drug store of this city is the dispensary tablet. It is dangerous, unnecessary and should be prohibited by law. The most visionary of us never dreamed that after we should give over our laboratory work to the large manufacturer we should further require him to furnish all our poisons and other potent substances in ready-weighed quantities, thus doing away with the need of prescription scales entirely. It is singular, but it is true, that where these dispensary tablets are found in great variety, the prescription balance is out of order. Everybody knows that it should be firmly set on a perfectly level surface and remain in the same place all the time. The torsion balance, with its pans above the beams and a handy adjusting screw is a mischievous contrivance for the reason that it can always be forced to balance, whether correct or not. The dram weight on such a balance will weigh a few grains more or less than 60 grains, but it balances just the same.

HOFFMANN'S ANODYNE A RARITY.

It may interest you to know that very few stores in this city are prepared to furnish the official article of Hoffmann's anodyne, and that the jobbers of this city do not carry the true ethereal oil for preparing it.

NO CASTILE SOAP IN DENVER?

How many of you are aware that castile soap, the only official and legal soap in this country, is no longer a drug store article? In its stead you are strenuously forcing upon the public a rank and dangerous imitation. While in Chicago I visited an establishment that was producing 30,000 pounds a day of oils from the city's garbage. These oils are used for making toilet soap, which I believe to be more safe and healthful for the baby's bath than the so-called castile soap sold in Denver drug stores.

A 25-pound package of "black antimony" attracted my attention recently by the ease with which I moved it with my foot. Such a bulk of the true article would have weighed 50 pounds. We placed a spoonful in a glass with some hydrochloric acid to test its solu-

bility and for the purpose of diffusing a little sulphuretted hydrogen through the store. We failed to diffuse anything. It was probably just common graphite.

DRUGGISTS' PROFESSIONAL WORK.

I have been digressing much from the subject I have chosen for my remarks to-day and fear that I have already consumed the time that you expected to give me.

To be brief, there are 181 stores in Denver. About 1,200 new prescriptions are written daily—less than that number in summer time and somewhat more in the winter months. One-fourth of these are dispensed in ten downtown stores. Further figures are unnecessary. No amount of energy or effort on your part will increase the volume of the prescription business. Even if you should be able to secure your neighbor's share, it would not be worth the effort.

Some other avenue to increased patronage must be found. Let us place our heads together and see where that avenue lies.

MUCH FOR DRUGGISTS TO DO.

In the meantime, let us be ever mindful that we are primarily, essentially and devotedly pharmacists. Do not think that as professional men our occupation is gone. There is still more unlearned in the sciences of food and drugs than was ever dreamt of in any chemist's philosophy.

As well might the practitioner of medicine think his occupation gone, as he reads the signs of the osteopath, the electropath and the chiropractor, and looks out on the costly temples erected to that supermest of fads, Christian science.

Differentiating Extract of Beef and Extract of Yeast.

Yeast, which is obtained in enormous quantities as by-product in breweries and distilleries, has been utilized for some years for manufacturing medicinal and food products, and extract of yeast, on account of its low price, has become a competitor of extract of beef. In order to find a method by which the two extracts can be distinguished and by which an adulteration of extract of beef with extract of yeast can be proven, Cook (*Ann. de la Brass. et Dist.*) has examined numerous samples of both beef and yeast extracts. He obtained the following analytical results: Yeast extract leaves more ash on incineration than beef extract, but the amount of chlorine is about the same in the ash of both, namely, about 2 per cent. Yeast extract contains about one per cent. of fat compared with 7 per cent. in extract of beef. The percentage of phosphoric acid is about the same in both extracts, but is slightly higher in yeast extract when calculated in both cases for the dry, fat-free products. While beef extract contains about 12 per cent. of nitrogen, yeast extract contains only about 7.5 per cent., calculated in both cases for the dry and fat-free extract. The main difference is, however, the absence of creatine and creatinine in yeast extract, which bases are present in beef extract to an extent of about 10 per cent. Both extracts contain about the same amount of purine bases, but while these bases occur in yeast extract in the form of adenine and guanine, they occur in beef extract as xanthine and hypoxanthine. Finally beef extract contains lactic acid, which is never present in yeast extract.

Pharmacopœial and Commercial Aconite.*

BY WILLIAM MANSFIELD, PHAR. D.

Various species of aconite have been used from ancient times, first for criminal purposes and in latter times for their medicinal value. The United States and British pharmacopœias recognize only the tuberous root of *aconitum napellus*, yet the requirements of the two pharmacopœias are quite different. There is no doubt about the kind of tuberous root official in the British Pharmacopœia as it states clearly that aconite must be grown in England and that the tuber must be collected in autumn and have an undeveloped flower bud. This means that it is the tuber separated from the tuber bearing the flower cluster at the close of the flowering season. The United States Pharmacopœia states that aconite is the dried tuberous root of *aconitum napellus* collected in autumn. In the description it says: "Slenderly conical, 4 to 10 cm. long, 10 to 20 mm. thick at the crown; occasionally split;" etc.; no mention being made of an undeveloped bud or a hollow stem base; so that apparently one may take his choice of a tuber with an undeveloped flower bud, which is a plump starchy tuber, or a tuber which is shriveled and heavily wrinkled, containing little starch and with a sunken stem base, that is, if the stem were cut on a level with the tuber.

Let us now consider the aconite of commerce. A very small percentage of commercial aconite consists of a starchy tuber with an undeveloped flower bud. These occur usually attached to the mother tubers. The tuber with the flower stem removed to the level of the tuber is not usual. The usual type of aconite of commerce is an aconite tuber which bore the flower cluster and with portions of the flowering stem, varying from $\frac{1}{4}$ to 3 inches in length. The United States Pharmacopœia does not allow any stem to be present, yet it is practically impossible to find a sample of aconite in the market without stems. This means that the average sample of aconite does not meet the requirements of the United States Pharmacopœia. Fortunately we have a chemical check on aconite, and if it yields 0.5 per cent. of aconitine upon assay, it will meet the official requirements chemically, if not botanically.

In order to see if the starchy tuber contained as much aconitine as the non-starchy tuber, assays were made of the tubers occurring in pairs after being separated and reduced to a number forty powder. The result of the analysis showed the non-starchy tuberous root to be richer in aconitine than the starchy tuberous root. While the evidence is not conclusive it tends to show the comparative amounts of the active constituents present in the starchy and non-starchy tuberous root. Economically only the tuber which bore the flower stem should be used. The separated daughter tuber may be planted to produce the flower cluster and a daughter tuber which at the close of its flowering period may be collected for market. It interested me to note that through the short rhizome which connects the two tuberous roots, two vascular strands pass, each with a distinct endodermis. If observed closely, many of the specimens will show where this rhizome has been cut across separating the two tuberous roots and showing the two vascular strands.

Briefly stated, there are five types of *aconitum na-*

* Read at the 1911 meeting of the American Pharmaceutical Association.

pellus on the market: first, starchy aconite with an undeveloped terminal flower bud; second, non-starchy aconite with a hollow stem base; third, non-starchy aconite with stem base attached (usual type); fourth, aconite in pairs, the non-starchy tuber with a hollow stem base or a portion of the stem, together with a starchy tuber having an undeveloped flower bud; and fifth, combinations of the above four types.

If the non-starchy tuber only be collected there would be insured a constant supply. There is no question but that the tuber bearing the flower cluster will, when freed from any portion of the stem, meet the official requirements. Specimen number one illustrates such a sample and assays 0.6 per cent. of aconitine. At any rate let the next United States Pharmacopœia state whether the tuberous root with an undeveloped flower bud, or the tuberous root which bore the flower cluster shall be used; and also what length of stem base, if any, will be allowed.

POWDERED ACONITUM NAPELLUS.

Powdered aconite stems exhibit many striking and characteristic cells. The epidermal cells occur usually as opaque or translucent reddish-brown fragments. It sometimes happens that the cell wall is broken and the contents forced out; it is then possible to see the outline of the epidermal cells and the stoma. The guard cells are clear and are found on a level with the surrounding cells (10). The transverse parenchyma (1) has about the same appearance in the powder that it has in the cross section. The longitudinal parenchyma with starch (2) is more abundant in a number eighty powder. Number 2' is longitudinal parenchyma with an intercellular space, but free from starch. The stone cells (3) vary in form and size and the walls and cells contents are often reddish-brown or, if the walls are whitish, the contents will be reddish-brown. The fibers (4) vary in length and diameter, the walls have simple pores and the one end is often square or blunt. The simplest conducting cells have spiral thickening of the walls, and this is often seen detached in the form of a true spiral (5). Pitted cells with bordered pores (6) and reticulate conducting cells (7) are found. Scattered throughout the field are found single rounded starch grains (8), with cleft hilum, two-compound grains with a V-shaped hilum, and compound grains with an indistinct hilum. The pith parenchyma cells (9) when seen in longitudinal view have numerous pores. The presence of aconite stems in powdered aconite is clearly shown by the fibers (4), by the thicker-walled parenchyma cells (2), by the epidermis with stoma (10), and by fewer stone cells. The fibers can also be determined chemically by an estimation of the crude fiber.

STRUCTURE OF THE CROSS SECTION OF ACONITUM NAPELLUS STEM.

In the cross section of the larger stem bases of aconitum napellus, there are fifty or more bundles. The fibers form nearly a complete ring with an arch of

1. Transverse parenchyma with intercellular spaces. 2. Longitudinal parenchyma with starch grains. 3. Stone cells (often with dark brown contents). 4. Fibers. 5. Conducting cells with spiral thickening and xylem parenchyma. 6. Part of a pitted vessel with bordered pores. 7. Reticulated conducting cells. 8. Starch, single and compound, scattered throughout the field. 9. Pith parenchyma with porous walls. 10. Stomata, guard cells and surrounding cells of the epidermis.

fibers just outward from each phloem portion of the bundle and extending inward often completely enclosing the xylem and forming a closed collateral bundle. This is true only of the older formed bundles. As the stem increases in diameter new bundles are formed which at first have fibers surrounding only the phloem portion of the bundle and then only a few cells wide. The cross section exhibits the following structure: The epidermal cells (1) are radially elongated, thin-walled cells with reddish-brown contents; the cortical

parenchyma cells (2) are thick-walled, nearly circular in outline, with prominent, mostly triangular intercellular spaces, becoming smaller and smaller as we near the fibrous sheath. Among the cortical parenchyma cells are found large thin-walled stone cells

Figure 2.
Cross Section of Aconite Stem.

1. Epidermal cells with reddish-brown cell contents. 2. Cortical parenchyma with intercellular spaces. 3. Stone cells. 4. Fibers. 5. Sieve and surrounding cells. 6. Ducts and tracheids. 7. Xylem parenchyma. 8. Fibers. 9. Pith parenchyma. 10. Intercellular space.

(3). Frequently not more than one is found between the epidermis and the fibrous layer, while in other sections several stone cells occur. The fibers (4) have a rounded outline, the walls are yellowish-white, thick, with small cell cavity and show clearly the line of sep-

aration of the fibers, which appear as a dark line between the cells. The fibers (8) inward from the xylem are thinner-walled than those surrounding the phloem. The cells of the phloem (5) are thin-walled and irregular in outline, no sharp distinction being seen between true sieve cells and surrounding cells. In some of the bundles the cambium cells are quite distinct; while in other bundles no characteristic cambium was observed. The conducting cells of the xylem (6) vary greatly in diameter and are surrounded by parenchyma cells (7). The pith parenchyma cells (9) are thick-walled, nearly circular in outline and filled with starch grains. The intercellular spaces (10) are larger than in the cortex and they are quite frequently quadrangular or pentangular.

Liquid Toilet Soap.*

By P. HENRY UTECH.

One of the chief sources of the pharmacist's revenue is derived, as you all know, from the sale of his own-make specialties. I would therefore like to call your attention to one such, which I do not believe is being extensively exploited as yet by the average pharmacist; one that can be easily prepared by himself, and one which will yield him a nice margin of profit in return. I refer to the preparation known as liquid toilet soap.

Until recent years liquid preparations of soap were very little used by the laity, being employed chiefly as an external form of medication in certain cutaneous diseases, the idea originating, I believe, with certain German dermatologists. But several natural advantages which they possess over the ordinary hard soaps for toilet and domestic purposes furnishes the occasion for introducing the subject to your notice at this time. Occurring as they do in liquid form, they are much more readily, as well as easily, adaptable to ordinary use for the toilet, bath, shampoo, etc. From a hygienic standpoint they also offer the advantages of immunity from infection, which is not infrequently caused by different persons using the same piece of soap in cake form. Hard soaps are likewise inferior to soap liquids, in that they have to become liquefied, or, rather, emulsified somewhat, before they exhibit their detergent property.

A new and very extensive field for the use of liquid soaps in germicidal combination has been developed recently, and no doubt your attention has already been called to their use in some of our larger public institutions, such as hospitals, hotels, etc. This idea was inspired, as you well know, by the widespread interest people have taken in matters of public hygiene and sanitation of late years. Soaps for such purposes could be easily made from the formula herewith appended, simply by incorporating a small quantity of phenol, mercury bichloride, formaldehyde, or any of the other ordinary germicides.

But the preparation which we have been most successful in exploiting is one which we have named "liquid aromatic shampoo soap." The formula is one suggested by Wilbert some years ago,† with but a slight modification. Numerous experiments were carried out with the ordinary fixed oils, such as linseed,

* Read at the 1911 meeting of the Pennsylvania Pharmaceutical Association.

† See THE DRUGGISTS CIRCULAR for October, 1907, page 631.—Editor THE DRUGGISTS CIRCULAR.

sesame, malaga olive oil and mixtures of these with cottonseed oil, but all were found to be objectionable for some reason or other.

The formula we now use is as follows:

Sodium hydroxide.....	80 grammes.
Potassium hydroxide.....	80 grammes.
Cottonseed oil.....	1,000 c.c. (mils).
Alcohol	500 c.c. (mils).
Water	2,500 c.c. (mils),

Dissolve the hydroxides in 500 c.c. (mils) of water. After solution has been effected, add the alcohol, and, finally, the cottonseed oil, in several portions, and shake thoroughly. Allow to stand for several hours, shaking the mixture occasionally, until thoroughly saponified. Finally add water sufficient to make 2500 c.c. (mils).

To the soap liquid thus prepared add:

Potassium carbonate.....	30 grammes.
Terpineol	12 c.c. (mils)

This soap can be made at a cost of about 75 cents a gallon. Dispense it in 4-ounce bottles at 25 cents. The trade packages of similar products seldom contain more, and retail at 50 cents—a good talking point. By putting a little personal push back of this product it can be made into a very profitable specialty.

Druggists and Habit-Forming Drugs.*

By DR. WILLIAM JAY SCHIEFFELIN.

During the last session of the sixty-first congress, which expired on March 4th, 1911, hearings were given by the ways and means committee of the house on the Foster bill, imposing a tax upon and regulating the production, manufacture and distribution of certain habit-forming drugs. Your president and the chairman of our committee on legislation, as well as other representatives of the drug trade, appeared at these hearings and gave their views upon this bill, which was sweeping in its requirements. The bill required every dealer to affix an internal revenue stamp and keep an accurate record, not only of all drugs named in the bill, but of all preparations containing them in any quantity, no matter how small. It would be practically impossible for dealers to comply with these requirements, and we urged the committee to amend it by not making it apply to the minute quantities. It is likely that this matter will come up again at the session of congress, which will convene in December next, and we know the members of this association are unanimous in their desire for the passage of a national law which will effectively regulate interstate traffic in habit-forming drugs, as stated in the resolution which we adopted at our meeting last year.

We who are in the drug business feel the responsibility involved in dealing in these habit-forming drugs. None of us wishes to make money by selling drugs which will harm our fellow men.

We cannot with a clear conscience try to prevent the passage of effective measures to control the sale of narcotics, nor is it enough for us to express our approval of such legislation and then use no effort to secure its enactment.

It is our duty to be familiar with the facts regard-

ing the effects of these drugs and also the extent of their use.

Nor should we confine our attention to drugs alone, because certain so-called soft drinks, which have been fortified by the addition of caffeine, are a menace on account of their habit-forming character. There can be no doubt that their promiscuous sale to children should be stopped.

Disintegration of Pills.

In a paper read at the recent meeting of the American Pharmaceutical Association, L. D. Havenhill and N. E. Stevenson gave an account of some experiments conducted by them to determine the rate of disintegration of pills of various sizes, ages, composition and coatings. They said:

"We endeavored to make the conditions of our experiments as favorable at least as those existing within the human body. In order to secure continued action from the disintegrating solution the pills were placed in wire cloth baskets and suspended in test tubes about 1/2 inch below the surface of the 20 c.c. (mils) of solution. These test tubes were placed in a water bath and a temperature of from 37° to 38° C. maintained throughout the experiment. The pills were rubbed gently with a glass rod about every five minutes to give us an opportunity to note the progress of disintegration as well as to simulate the action of the muscular coats of the digestive organs. The effect of this manipulation with the glass rod was subsequently ascertained to shorten the time of disintegration about 20 per cent. Two disintegrating liquids were used, (1) an aqueous solution containing 2 per cent. of pepsin and 0.25 per cent. of hydrochloric acid, and (2) distilled water. The maximum variation in any case was not more than 10 per cent. of the mean result. . . .

"A little more than 50 per cent. of the pills were more rapidly disintegrated in water than in pepsin solution. It was thought that the colloidal nature of the pepsin might have been responsible for this, but repeated experiments with the solution to which peptone had been added failed to confirm this opinion. In only one instance did the kind of coating make any material difference in the rate of disintegration in the different liquids. This pill had a thick coating of gelatin and required 530 minutes in water or nearly four times as long as in the pepsin solution. Fifty-six per cent. of the pills in pepsin solution and 53 per cent. in water were disintegrated within sixty minutes and in each solution 90 per cent. were disintegrated within ninety minutes. In most of the cases where disintegration was slow the therapeutic nature of the pill was such that this was not seriously objectionable.

"It may be said that our results tend to show that the rate of disintegration depends primarily upon the composition, size, and coating, and that the age exerts only a slight influence."

Lubricant for Glass Stop-Cocks.

The following formula for making a lubricant for glass stop-cocks is given in the *Journal de pharmacie et de chimie*: 12 grams of petrolatum and 1 gramme of paraffin are heated in a porcelain dish and into the hot solution 16 grammes of gutta-percha, cut in small pieces, are added with constant stirring and the heating continued until a homogeneous mixture is obtained. The mass is then allowed to cool.

* Portion of the presidential address delivered at the recent meeting of the National Wholesale Druggists' Association.

Suggestions for Changes to be Made in the Pharmacopœia.

At the recent meeting of the New York State Pharmaceutical Association an elaborate report was made by the committee on pharmacopœial revision, of which Dr. George C. Diekman was chairman. It is noted that some of the recommendations made in this report have been adopted by the official committee of revision. Herewith are presented a few excerpts from Dr. Diekman's excellent report:

Tincturi Opii.

Tincture of Opium.

Granulated opium.....	100 grammes.
Alcohol	500 c.c. (mils).
Diluted alcohol, a sufficient quantity, Water, a sufficient quantity, To make.....	1000 c.c. (mils).

Heat 500 c.c. (mils) of water to boiling, and pour it on the granulated opium and stir thoroughly, occasionally, until the mixture becomes cold. Strain through muslin, expressing the residue, and reserve this infusion. Repeat the extraction with portions of 250 c.c. (mils) of water until the opium is exhausted. Evaporate the second and succeeding portions of infusion, on a water-bath, to a soft extract. Dissolve this extract in the reserved infusion, and transfer to a calibrated bottle, using the alcohol. Dilute to 1000 c.c. (mils) with water. Mix thoroughly and allow to stand over night. Decant through a filter, and wash the bottle and filter with enough diluted alcohol to make the filtrate measure 1000 c.c. (mils).

Cataplasma of Kaolin is all right when freshly made as called for. It is then not necessary to heat the kaolin.

[It should be noted that germs of tetanus, etc., may be present in the kaolin; hence thorough heating is a wise precaution.—Editor THE DRUGGISTS CIRCULAR.]

Compound Antiseptic Solution would be improved by the addition of a small amount of glycerin.

Making Tinctures from Fluidextracts: While this may be permissible in a few cases, the great danger is in the abuse. There is reason to believe that there are quite a number of druggists and physicians who carry this easy process to the extreme and make such preparations as paregoric, tincture of benzoin, and compound tincture of benzoin from fluidextracts, and even fluidextract of asafetida (so-called) is sold for the purpose of making tincture and milk therefrom. On several occasions these have been compared with U. S. P. preparations and the difference was very marked.

Mercurial Ointment: To the formula add some wool-fat. This will expedite the division of the mercury.

Elixir Ferri, Quininae et Strychninae Phosphatum.

Elixir of the Phosphates of Iron, Quinine and Strychnine.

Soluble ferric phosphate.....	32.00 grammes.
Quinine phosphate.....	8.50 grammes.
Strychnine phosphate.....	0.24 gramme.
Alcohol	250.00 c.c. (mils).
Oil of sweet orange.....	2.00 c.c. (mils).
Glycerin	300.00 c.c. (mils).
Distilled water, sufficient to make	1000.00 c.c. (mils).

Dissolve the ferric phosphate in 300 c.c. (mils) of distilled water by cold maceration; dissolve the quinine and strychnine phosphates and oil of sweet orange in the alcohol, warming if necessary, to effect solution; add the glycerin to the iron solution, then the alcoholic solution and enough distilled water to make 1000 c.c. (mils). Allow to stand for twenty-four hours and filter.

The following improved formula by S. A. Sharp, if carefully followed, proves a speedy method and results in a permanent preparation:

Strychnine phosphate.....	0.275 gramme.
Quinine phosphate.....	8.75 grammes.
Soluble ferric phosphate.....	17.50 grammes.
Phosphoric acid (85%).....	2.00 c.c. (mils).
Potassium citrate.....	2.00 grammes.
Diluted alcohol.....	150.00 c.c. (mils).
Distilled water.....	150.00 c.c. (mils).
Elixir of orange, enough to make	1000.00 c.c. (mils).

Dissolve the scaled iron phosphate in 150 c.c. (mils) of distilled water with the aid of heat; and the quinine phosphate in the 150 c.c. (mils) of diluted alcohol, con-

taining the phosphoric acid. To the solution of iron phosphate add the potassium citrate and the strychnine phosphate. Heat the elixir of orange to about 100° F. in a closed vessel and add the solution of quinine phosphate, and lastly the solution containing the iron, strychnine and potassium citrate, previously warmed to about 100° F. Filter, if necessary, and protect the elixir from light, in dark amber-colored bottles.

Camphor: Charles H. LaWall has studied the degree of volatility of camphor in order to determine the ground for the defense often made when a manufacturer is prosecuted for deficiency in strength, when discovered in preparations and claim it is due to volatility of the camphor.

Lump camphor lost by volatilization in one day 1.56 per cent.; in four days, 8.74 per cent.; in fourteen days, 23.46 per cent.; in twenty-eight days, 43.36 per cent.; in forty-five days, 61.95 per cent.

Powdered camphor lost by volatilization in one day, 18.8 per cent.; in four days, 33.3 per cent.; in fourteen days, 83.7 per cent.; in twenty days, 99.9 per cent.

Liniment of camphor lost in fourteen days, 0.25 per cent.; in one month, 0.79 per cent., so that after the one month's exposure at about 40° C., a preparation originally 20 per cent. strength retained 19.21 per cent. of camphor.

Spirit of camphor increased in strength upon exposure due to the more rapid volatilization of alcohol; being of a strength of 10 grammes in 100 c.c. (mils) originally, in one month the strength was found to be 12.04 grammes in 100 c.c. (mils).

He concludes that the normal loss of camphor by evaporation in preparations of camphor is negligible.

Collodium Cantharidatum.

Cantharidal Collodion.

Cantharides, in fine powder.....	60 grammes.
Glacial acetic acid.....	5 c.c. (mils).
Pyroxylin	4 grammes.
Camphor	1 gramme.
Acetone..a sufficient quantity to make	100 grammes.

Mix the glacial acetic acid with 55 c.c. (mils) of acetone and moisten the powdered cantharides with this mixture, setting it aside in a closely covered container for twenty-four hours. Then pack it in a cylindrical percolator and slowly displace with acetone until exhausted. Reduce the percolate by distillation, on a water-bath to 95 grammes and when cold dissolve in this the pyroxylin and camphor. If necessary, make up weight with acetone to 100 grammes.

It is stated that this preparation is a marked improvement over the cantharidal collodion now official and should replace it in the next revision.

Fluidextractum Glycyrrhizæ.

Fluidextract of Glycyrrhiza.

The following improved formula for this fluidextract is suggested:

Glycyrrhiza	1000 grammes.
Ammonia water.....	50 c.c. (mils).
Alcohol, a sufficient quantity, Water, a sufficient quantity, To make.....	1000 cc. (mils).

Mix the ammonia water with sufficient water to make 1000 c.c. (mils), and having moistened the ground drug with 700 c.c. (mils) of the mixture, pack it in a cylindrical glass percolator; then add enough menstruum to saturate the drug and leave a stratum above it. When the liquid begins to drop from the percolator close the lower orifice and, having closely covered the percolator, allow it to macerate for forty-eight hours. Then allow the percolation to proceed gradually, adding first, the remainder of the menstruum and then water until the drug is exhausted. Reserve the first 500 c.c. (mils) of the percolate and add to this 250 c.c. (mils) of alcohol and set the mixture aside in a stoppered bottle. Evaporate the remainder of the percolate to a soft extract; dissolve this in the reserved portion and allow the mixture to stand for two or three days. Then filter and wash the filter with a mixture of alcohol one volume, water three volumes, to make the fluidextract measure 1000 c.c. (mils).

Syrupus Aurantii. Syrup of Orange.

The present official method is destructive of the fine aroma of the tincture of sweet orange peel and leaves with the magnesium carbonate a large proportion of the flavor. The following is recommended as an improvement, retain-

ing all the flavor of the tincture and not exposing this to oxidation:

Tincture of sweet orange peel.....	50 c.c. (mils).
Citric acid.....	5 grammes.
Glycerin	100 c.c. (mils).
Syrup..a sufficient quantity to make 1000 c.c. (mils).	

Dissolve the citric acid in 500 c.c. (mils) of syrup mixed with the glycerin. Gradually add the tincture of sweet orange peel, shaking after each addition, then add sufficient syrup to make 1000 c.c. (mils). The improvement in flavor over the present U. S. P. formula is marked and the opalescence is scarcely perceptible.

Syrupus Ipecacuanhæ.

Syrup of Ipecac.

This syrup may be readily prepared direct from the powdered drug without any deviation from the official strength or ingredients. The following is the improved formula proposed:

Powdered ipecac.....	70 grammes.
Acetic acid.....	10 c.c. (mils).
Glycerin	100 c.c. (mils).
Sugar	750 grammes.
Water..a sufficient quantity to make 1000 c.c. (mils).	

Percolate the ipecac with a mixture of the acetic acid, glycerin and 290 c.c. (mils) of water, and then continue the percolation with water until 600 c.c. (mils) of percolate are obtained. In this dissolve the sugar, and add a sufficient quantity of water to make the product measure 1000 c.c. (mils).

Syrupus Kramerieæ.

Syrup of Krameria.

The official formula illustrates the use of fluidextracts to the limit and despite the relatively large amount of alcohol present, does not keep well. Mr. E. Fullerton Cook characterizes this syrup as "pharmaceutically unsatisfactory." He adds: "When the fluidextract and syrup are mixed, a coagulated mass, almost too thick to pour, results. As this syrup stands it separates into two layers, a clear, dark-reddish liquid above, and a cloudy portion occupying about three-quarters of the bottle with a heavy precipitate at the bottom."

For this, the following formula is submitted:

Krameria (No. 20 powder).....	450 grammes.
Glycerin	225 c.c. (mils).
Sugar	650 grammes.
Water..a sufficient quantity to make 1000 c.c. (mils).	

Mix the glycerin with 675 c.c. (mils) of water and percolate the krameria with this mixture; then continue percolation with water until the drug is extracted; evaporate the percolate to 650 c.c (mils) and in this, while still warm, dissolve the sugar. Strain the liquid and add sufficient distilled water to make 1000 c.c. (mils) of product.

As an alternative formula:

Fluidglycerate of krameria.....	450 c.c. (mils).
Syrup	550 c.c. (mils).

Mix.

Either of these formulas yields a clear liquid which keeps fairly well without gelatinizing or precipitating.

Syrupus Scillæ Compositum.

Compound Syrup of Squill.

In order critically to test the official formula, samples of fluidextract of squill and fluidextract of senega were prepared strictly in accordance with the Pharmacopœia.

The following formula is the result of an experiment:

Squill (No. 20 powder).....	80 grammes.
Senega (No. 20 powder).....	80 grammes.
Antimony and potassium tartrate...	2 grammes.
Acetic acid.....	20 c.c. (mils).
Glycerin	100 c.c. (mils).
Sugar	700 grammes.
Water..a sufficient quantity to make 1000 c.c. (mils).	

Mix the drugs and moisten with sufficient of a mixture of the glycerin, acetic acid and 300 c.c. (mils) of water. Place loosely in a percolator, cover, and allow to macerate for twenty-four hours. Then shake down so as to pack lightly and proceed to percolate, using the remainder of the menstruum, and then water until exhausted. Reserve the first 500 c.c. (mils) of the percolate; evaporate the remainder to 100 c.c. (mils), in which dissolve the antimony and potassium tartrate, and when cold, filter into the reserve; then dissolve the sugar by agitation. Strain, if necessary, and add sufficient water to obtain 1000 c.c. (mils) of the product.

Unfit Candidates for West Point.*

That the defeat of Napoleon at Waterloo was merely due to an oversight; that Robert E. Lee and Stonewall Jackson fought the battles of Trenton and Princeton; that Nebuchadnezzar was a prophet, "noted for his foreseings," and that Mason and Dixon's line divides the States of Maryland and Georgia were a few of the historical and literary discrepancies discovered in the entrance examination papers of many young men who recently were nominated for cadetship in the United States Military Academy by senators and congressmen from various States in the Union. Needless to say none of the young men who handed in the papers containing the above interesting "facts" was admitted to the academy.

Excerpts from the entrance examination papers referred to form one of the most interesting parts of the annual report of Maj.-Gen. Thomas H. Barry, the superintendent of the academy, which report is made public to-day. Gen. Barry refers regretfully to a condition which, he says, seems to indicate that proper care is not exercised in the selection of candidates for West Point cadetships, and also that the methods of instruction in vogue in the schools of the country are not satisfactory.

Gen. Barry cites questions that were put to candidates in the examination of July 5th last, those answering them being required "to exhibit a fair knowledge of the names of the most prominent English and American authors and of the names of their principal works."

This is what happened to Robert Burns of Scotland when a question involving a knowledge of his life and works was asked. The answers are from the original papers, delivered to the authorities at West Point:

Robert Burns was and English he was born in England and his parents were very poor. All during Roberts early child hood he showed that he was very bright. He is considered one of the greatest English His poems sound different from that of the other poets. The sound much more smoother. * *

Burns early education was obtain thro his mother and a poor school. To which he could attend only a few months a year.

As Burns grew in man hood he feel in with companions. The results were he became a drunken. * * *

Burns was of Scotch descent. His people were poor and ignorant. His opportunities were not good but he was determine. The poetical blood seemed to have run through his veins. He knew the peasant life well and it influenced his works of later years. No poet has even been able too surpass him in describing the peasant life.

Another question required a knowledge of Napoleon and the battle of Waterloo. Here are three of the answers:

* Any connection which this article has with pharmacy or the drug business is so slight that some sort of explanation or apology for its appearance here seems due to our readers. The article is here presented simply because it has some bearing on the general unpreparedness of many young men who have attended school for years, to qualify mentally for serious vocational study, whether that study be of pharmacy or of military art and science. There is this difference, however, between the outlook of the young man who would enter our government military academy and the one who would study pharmacy at college: the latter can always find some college glad to take his money and count him in to swell the total number of its students and graduates, even though he may never be able to "pass the board" and become a full-fledged pharmacist.

The present article reached us in the shape of a press dispatch from West Point, dated October 11th, printed in the daily papers.—Editor THE DRUGGISTS CIRCULAR.

The battle of Waterloo where Napoleon the most noted and powerful ruler also general that Europe has ever produced is what met his defeat his defeat was merely an oversight on his part.

The Battle of Waterloo was fought between the French and English. The French were led by Napoleon and the English by Lord Wellington.

Napoleon had captured most of Europe and had been carrying on a war against England. The English were the better on seas but the French beat them on land.

Examples of failure to exhibit a fair knowledge of English literary history are found in the following answers to the question: "In a few paragraphs, mention the chief characteristics and the most important writers of the nineteenth century English literature."

The important writers of the 19th Century were nearly all raised as poor boys from poor families. The one we should class first among them is Longfellow. After his death. The people of England thought so much about him, they ask for his bust for the Poets Corner in Westminster Abbey. It stands in a prominent place to-day.

There were a number of good writers such as Johnson, Jonson, Tennyson, and etc.

The age as a whole may be classed as the Interdiction of the Novel because the majority of the work was prose and the majority of the prose were novels we have of coarse poets, such as Wordsworth, Shelly, Keats, Byron. But we also have Dickens, George Eliot, Thackeray, Carlyle with his essays The characteristics of the literature was love of nature in Burns and Wordsworth.

Some of the most important writers of the nineteenth century are Ellen Wheeler Wilcox, Elbert Hubbard, Jack London, Walt Whitman and Dorothy Dix. Among this number two of them are women and their pieces and writings are very interesting. Elbert Hubbard is somewhat of a philosopher. He is also a splendid writer. He wrote the Doctor and a good many other books. Jack London is more of a novelist than a writer. His chief work is writing up prize fights and other things. Walt Whitman is called the poet philosopher and his works are very interesting. He writes for all of the newspapers.

"As evidence of complete unfitness," Gen. Barry says, "to take the examination in history for this academy, the following answers to questions asked in the recent examination are submitted:

Nebuchadnezzar was a prophet and was noted for his foretellings. He told the certain things would happen and they did happen.

He was ancient king and was a soldier. He compelled to eat grass and live in the forest for about nine years. He founded the city Nineveh.

Nebuchadnezzar was an Egyptian ruler, noted for founding a library. Gave Egypt a good start.

Macedonian Phalanx was a division of the Army of Macedonia. Roman Legion was the Roman army.

In the battle of Crecy these opposing forces met and the result was in favor of the Romans.

The Republic of Panama was established by the United States against the wishes of England in about 1807. We almost had trouble on account of our "Monroe Doctrine."

The Mexican Government was unbearable thereby causing the southern part to rebel and form a republic.

Panama was under the control of Venezuela. She was mistreated and misgoverned and asked foreign nations for recognition as independent. The U. S. sent fleets over to Venezuela and forced her to recognize Panama's independence.

Gen. Barry, in commenting on these and other answers, says that "it is incredible that if proper means are used to find suitable applicants the honor of an appointment as candidate for entrance to the military academy should go begging. There are surely thousands of young men in this country well grounded in the essential branches required of candidates who would welcome the chance to enter the military service as a cadet. It seems reasonable to urge that the fitness of the appointees be thoroughly tested before they are allowed to take the entrance examinations."

Three entrance examinations have been held at

West Point since January of this year. For the first examination 553 candidates were nominated. Of this number 165 failed mentally, but qualified physically; 42 failed both physically and mentally, and 15 qualified mentally but were rejected for physical reasons. Of the remainder, 122 failed to report for the examination and 170 successfully passed it. In the second examination 96 of 242 candidates failed mentally, 40 failed to report, 9 qualified mentally but failed physically. Seventy-eight passed the examination. On July 5th, 83 young men were nominated. Forty-nine of the 83 failed mentally, and of the total only 15 were found to be qualified for admission to the academy.

Gathering Rubber.*

The importations of crude rubber have grown steadily through the decades, as shown in the round figures: In 1889, 16,800,000 pounds; in 1890, 33,850,500 pounds; in 1900, 49,400,000 pounds; in 1908, 63,300,000 pounds; in 1909, 83,359,895 pounds; in 1910, 101,044,681 pounds; while in 1911 they fell to 72,046,260 pounds.

The term "Para" rubber is current in the rubber manufacturing trades. More distinctly this rubber might be called Amazon rubber, for the Brazilian supply comes almost exclusively from that great river and its tributaries. Para, eighty miles inland on the main channel of the Amazon, is one of the several ports of shipment, and one of the largest.

Everything and anything that will float as a craft is used in taking the rubber gatherer to and from his field of milk trees. He may take his outfit into the steamerage portion of a magnificent steamer and travel a thousand miles up the mighty river; or he may equip himself with some sort of flat-bottom scow and spend months getting up into the far tributary regions where he is to find his forest of work.

Working up against the heavy currents of the Amazon and its tributaries, the rubber collector hugs the shores and poles and paddles and pulls his craft—anything to get there with his craft. There's little enough in the boat that even a hungry Dusty Rhodes would think of taking.

There's the invariable yellow dog. The senora and the dark kids and the baby are there. One or two shotguns one hundred years out of date, cotton hammocks, two dented zinc trunks, several pails, miscellany that could not be interpreted north of the Panama ditch, and particularly a green parrot sitting dejectedly somewhere on some kind of a perch. This is the outfit, together with whatever of food supplies brought from Brazilian civilization have been advanced to him on credit by the merchant to whom he is to sell later the crude rubber for which he is in search.

But whether the rubber collector thus equipped goes up in his boat or pays the freight for himself, family and equipment, he must leave the steamer somewhere at the mouth of a swift tributary, if he has chosen that route, and then it is literally a case of taking to the woods.

It is the simple life there. So simple that most of the family would be locked up if they appeared that way in Chicago on a summer day when the thermometer is high in the nineties. The rubber collector himself has the bulk of the clothing, protecting him

* Abstract of an article in *Chicago Tribune*.

from the saw-edged grass, thorns and thickets, to say nothing of the poisonous animal life that may menace him. He leaves his thatched roof tree with his frowsy wife and dark, naked children, and with a big knife, a shotgun, a galvanized pail and a number of "nested" tin boxes akin to cake tins, takes to the habitat of the rubber trees which have been assigned to him.

With the big knife he "taps" the first giant tree of the botanical *hevea braziliensis* class, starts the white sap running, and, with a bit of a stiff clay, fastens the pan to the tree to receive it.

If he is working briskly—making allowance for the word brisk in such a climate—he is ready to turn back with his pail within an hour or so to that first tree, empty the tin box into the pail, replace it, and follow on down the line of his tappings. He should have a pail full of the sap when the day is done and he lugs it home by main strength—a strength built upon the regulation jerked beef, black beans and yellow tapioca.

At home he builds his fire, ladles out sap from the pail, holds it over the heat and smoke of the fire until it begins to harden, then pours it into a heated iron pot. Ladle after ladle is treated this way until, when the sap pail is emptied and the pot is cooled, he dumps out an ovoid lump of rubber not unlike a foot ball in shape and sometimes larger and sometimes smaller than the regulation "pigskin" of the universities. And this is the crude rubber of our commerce, of which we need a pound a year for every man, woman and child in the nation.

This rubber collector has not worked uncomfortably hard, but neither has he loafed on the job. If he has worked only one season previous to this he understands that his employer who "staked" him is going to have a tremendous offset account against him by the time he gets back from his season's work.

Under the tropic sun and in the swampy country he is sure to contract malaria. To offset it he takes huge quantities of almost any kind of drug that tastes nasty enough to encourage his hopes. Often the fatal beriberi attacks him, his legs swell to immense size, and he may die inside any given five minutes by the watch.

Then there are the Indians who not only don't like the rubber collector, but who do like some of the stuff to be found in the rubber station's storehouse—rum and gunpowder, for example. And year after year some of these stations in the woods go up in the smoke of the incendiary Indian and the collector and his family disappear forever.

But we may need two pounds of rubber per capita in the next ten years; which means that rubber hunting must go on, regardless of the rubber hunter and his long chances against death.

Date Stones as a Cattle Food.

In southern Tunisia ground date stones are used quite extensively by the natives as a food for asses and camels. This meal has been analyzed by de la Gardelle (*Chem. and Drug.*), who concludes that it is of real alimentary value as it contains about 24 per cent. of carbohydrates; 10 per cent of nitrogen; and 2 per cent. of fatty matter. We have no mention, however, as to whether the stones have been actually proved to be digestible.

Winter Washes for Fruit Trees.

The appended formulas are offered by the *Chemist and Druggist*:

Alkali Winter Wash.

Sodium hydroxide (98%).....	1 pound.
Potassium hydroxide (80%).....	1 pound.
Common treacle.....	$\frac{3}{4}$ pound.
Water to make.....	1 gallon.

Dissolve the two hydroxides separately in a little water. When the solutions have cooled, mix them, add the treacle, then the rest of the water.

For use, 1 part of this wash is to be diluted with 99 parts of water.

Woburn Winter Wash.

Soft soap.....	$\frac{1}{2}$ pound.
Kerosene	5 pints.
Sodium hydroxide.....	$2\frac{1}{2}$ pounds.
Water.....	enough to make 2 gallons.

Dissolve the soap in 4 pints of water, heating if necessary; incorporate thoroughly the kerosene; add the sodium hydroxide and the rest of the water.

One gallon of this mixture should be diluted with water to make 50 gallons of wash.

Witchhazel Lotion.

Quince seed.....	45 grains.
Boric acid.....	5 grains.
Benzoic acid.....	5 grains.
Glycerin	2 ounces.
Alcohol	3 ounces.
Oil of rose geranium.....	1 dram.
Oil of bitter almond.....	30 minims.
Glycerite of starch.....	2 ounces.
Hamamelis water.....	enough to make 1 pint.

Dissolve the two acids in 8 ounces of hamamelis water; macerate the quince seed in this solution for 3 hours; and strain. Beat up the glycerite with the glycerin; and gradually incorporate with constant beating the quince seed solution. Finally beat in the oils dissolved in the alcohol, adding the solution slowly; and add enough hamamelis water to make the required volume.

Liquid Metal Polishes.

The appended formulas are from the *Pharmaceutical Journal*:

I.

Levigated silix.....	10 pounds.
Kerosene	5 gallons.
Oleic acid.....	2 gallons.
Stearic acid.....	2 pounds.

II.

Kieselguhr	56 pounds.
Kerosene	30 pounds.
Alcohol	20 pounds.
Oil of turpentine.....	5 pounds.
Ammonia water (sp. gr. 0.910)...	$3\frac{3}{4}$ pounds.

Bag Blue.

Ultramarine	30 parts.
Sodium bicarbonate.....	20 parts.
Glucose	6 parts.

Mix the color and the sodium salt, and knead in the glucose.

This mass is to be pressed into balls and tied up in small squares of linen.

Abstracts

Test for Cocaine.

Seiter (*Am. Journ. Pharm.*) criticises the various tests for cocaine now in use, and puts forward the following as the most delicate: To 1 c.c. (mil) of cocaine solution add one drop of 25 per cent. sulphuric acid and 1 c.c. (mil) of saturated potassium permanganate solution. After allowing the liquid to stand some time, place a drop on a slide, adjust a cover glass, remove the excess of liquid and draw a drop of water under the glass by means of a piece of filter-paper placed on the opposite side. The slide is then to be examined under the microscope for the characteristic violet-red rectangular plates of cocaine permanganate. In this way the author has detected cocaine hydrochloride 1 in 3000. Other common natural alkaloids and cocaine substitutes, with the exception of *a*- and *b*-eucaine, when treated by the above test were instantly oxidized. The two eucaines reduce the permanganate very slowly. *a*-Eucaine yielded very small irregular masses of violet-red leafy crystals in 1 per cent. solutions. In high dilutions (1 in 6000) the crystals were better formed and resembled those of ammonium-magnesium phosphate. The limit for the formation of the *a*-eucaine permanganate crystals is 1 in 5000. *b*-Eucaine in 1 per cent. solutions yielded minute violet-red globules, which did not crystallize on standing, but gave no reaction when less was present. The crystals were examined under a magnification of eighty diameters in all cases, except the *a*-eucaine crystals, which required the use of a higher power.

Estimation of Chloral Hydrate.

Bourdet (*Journ. pharm. chim.*) calls attention to the fact that when the method of the Codex for the estimation of chloral hydrate is used, the distilled water employed must recently have been freed from carbon dioxide and cooled. Commercial distilled waters, obtained by continuous acting stills, contain appreciable quantities of carbon dioxide. Also a water which was free from the gas at the time of manufacture gradually absorbs the gas. If this proposed precaution is not taken, the method of the French Pharmacopœia gives values that are too high. At the same time, the author advocates the use of N/2 soda solution instead of the normal, and the time of contact of alkaline solution with the chloral solution should be reduced to a quarter of an hour. In this time, the action is complete and the decomposing action of the water on the chloral is in a measure reduced.

An Old Remedy for Hiccough.

Anent contributions on the treatment of hiccough to the *New York Medical Journal*, the editor writes that a popular and easily obtained remedy was overlooked. "Like the other remedies advised," he says, "it is not infallible, but occasionally it succeeds." It consists in the inhalation of carbon dioxide, always immediately procurable by squirting two or three ounces of any of the charged waters from the syphon into a glass and placing the latter under the sufferer's nose. After a series of deep inspirations the patient swallows the water. If this treatment happens to be a novelty to the patient, so much the better; the psychical effect is excellent.

Hypodermic Injections of Oxygen in Asphyxia.

Maissonet (*Journ. méd. chir.* through the *Practitioner*) has experimented in hypodermic injections of oxygen in asphyxia, first suggested by Raimond. He found that the relief obtained was remarkable, and considers the method greatly superior to inhalations. The patient from the beginning of the treatment feels better, and the respirations become longer. After disinfecting the skin of the outer surface of the thighs with tincture of iodine, a sterilized needle is pushed into the subcutaneous tissue, care being taken not to introduce the needle into a vein and thus cause gaseous embolism. A tube from an oxygen cylinder is then attached to the needle; into this tube there should be let in a piece of glass tubing containing a little sterile cotton wool to act as a filter. The gas is allowed to bubble gently under the skin for about twenty minutes, sufficient being allowed to pass to form a swelling similar to that set up by an injection of about 300 c.c. (mils) of normal saline solution. Light massage is then performed to assist in the diffusion of the gas and promote its absorption. No trouble has been known to follow an injection; there is no pain, and absorption is quickly effected.

Gangrene from Carbolic Acid Ointment.

To the many cases of gangrene and consequent loss of extremities from the application of carbolic acid (phenol) dressings Schussler and Stern (*Journ. Am. Med. Asso.*) add still another. The patient, a man, received a slight scratch on the finger. He applied a 5 per cent. phenol salve on a closed dressing, according to instructions given him by a druggist who sold the salve. A week later the finger was gangrenous from the distal end of the proximal phalanx to the root of the nail. The gangrene was dry and the finger was completely mummified and as hard as a stone. After treatment to separate the devitalized parts the finger was amputated. References to a large number of other cases were made in the CIRCULAR for last month, page 573.

Removing Plaster of Paris Dressings.

Stransky (*Sem. méd.*) says that notwithstanding the use of special instruments for the removal of plaster of paris dressings, the operation is often troublesome, and in the case of a recent fracture may cause injury. Methods of softening the plaster by water, either alone or with the addition of salt, are rarely successful, as the apparatus becomes coated with a layer of grease which prevents their action. The author has obtained satisfactory results by moistening the line of section with vinegar applied on a tampon of wool. After a minute the plaster will be found completely softened so that it may be easily divided with a pocket knife or ordinary scissors—a procedure easy for the surgeon and painless for the patient.

A Sanitary Improvement in the Water-Closet.

Hartung (*Münch. med. Woch.* through *Journ. Am. Med. Asso.*) discusses the insanitary feature of having the water-closet flushing apparatus operated by a handle or chain to be taken in the hand. He suggests that a knob or pedal worked by pressure of the foot would be far more sanitary and prevent much contamination.

Detection of Alcohol in the Presence of Acetone.

It is said that the most sensitive test for alcohol is potassium dichromate with sulphuric acid. The test is, however, of no value, when the liquid under examination contains aldehydes, ketones and many other substances. By replacing sulphuric with nitric acid, solutions which contain alcohols, aldehydes, glycerin, sugar, etc., give the bluish-green color at once, while aliphatic and aromatic ketones react only very slowly. Agulkon (*Bull. scienc. pharm.*) found a reagent prepared by dissolving 50 grammes of acid potassium sulphate in 50 c.c. (mils) of water containing 0.5 gramme of potassium dichromate very useful for detecting alcohol and aldehydes in the presence of ketones. Solutions boiled with the reagent give a green color when the former are present, but do not give any reaction when they contain acetone only. This reaction may also be used for distinguishing castor oil from olive oil, linseed oil and pea-nut oil, as only castor oil gives a distinct green color with the reagent.

Estimation of Chlorine in Organic Substances.

Warunis (*Chem. Zeit.*) recommends the following method for estimating chlorine in organic substances: 0.2 to 0.3 gramme of the finely powdered substance is intimately mixed with 10 grammes of powdered potassium hydroxide and 5 grammes of sodium peroxide, transferred to a crucible and covered with a suitable quantity of a mixture of potassium hydroxide and sodium peroxide (2 to 1). The crucible is then covered with a lid and heated in a drying oven at 75 to 80° C. until the mass begins to melt. The crucible is then heated over a flame until a uniform melt is formed, which is kept in the molten condition for a short time. The melt is then dissolved in cold water, the solution, after cooling, acidulated with nitric acid and the halogen determined in the usual way.

Nature of Verbascose.

Bourquelot and Beidel (*Journ. pharm. chim.* through *Pharm. Journ.*) say that verbascose, the sugar of the leaves of *verbascum thapsus*, has been shown to yield levulose, glucose, and galactose when hydrolyzed. It would appear, therefore, to be allied to stachyose, which furnishes the same hexoses on hydrolysis. But it is found that the hydrolysis of verbascose with invertin is very much slower than that of stachyose. The two sugars, therefore, are probably not isomers. This indicates that verbascose has a higher molecular weight than stachyose, just as stachyose and raffinose are known to differ, where the rate of inversion is also different.

Action of Nitric Acid on the Aloins.

Stenhouse and Tilden found that by the action of nitric acid on aloin, chrysaminic acid and picric acid are formed. Léger (*l'Union pharm.*) states, however, that these substances are only secondary products, the primary product obtained by the action of nitric acid on barbaloin or iso-barbaloin being tetranitro-aloeemodin. On prolonged action of nitric acid on this compound chrysaminic acid is formed, which is split up into trinitro-meta-oxybenzoic acid, which finally yields picric acid.

Estimation of Caffeine in Caffeine-Sodium Salicylate and Similar Products.

Caffeine is estimated in caffeine-sodium salicylate by the following method recommended by Lehmann and Mueller (*Apoth. Zeit.*): 1 gramme of the salt is dissolved in 5 c.c. (mils) of water, the solution mixed with 40 grammes of chloroform and 5 grammes of 15 per cent. caustic soda solution and the mixture shaken well for five minutes. After the addition of 0.5 gramme of tragacanth, the mixture is shaken again, allowed to clear and decanted; 35 grammes of the chloroform solution are then evaporated in a tared flask and dried at 100° C. to a constant weight.

Fraxin in Bush-Honeysuckle.

When a small piece of the stem or the root of *dier-villa lutea* (bush-honeysuckle) is macerated with a weak alkali, a solution results which is strongly fluorescent in reflected light. According to Charaux (*Journ. pharm. chim.*) this fluorescence is due to fraxin. The glucoside isolated from bush-honeysuckle was identical with that obtained from European ash. In addition to fraxin, the author succeeded in isolating another substance, which, when purified, occurs as an amorphous white powder giving a violet-red color with concentrated sulphuric acid. By hydrolysis with diluted mineral acids it was split up into a water-insoluble substance and a reducing sugar. The glucoside seems to belong to the saponins.

Detection of Arsenic Acid in the Presence of Phosphoric Acid.

According to Maderno (*Att. R. Accad. Sci.* through *Schweiz. Woch.*) if a solution of the mixed alkali salts of arsenic acid and phosphoric acid is made slightly acid with acetic acid and, after adding 10 to 15 c.c. (mils) of a concentrated solution of ammonium nitrate, is heated to boiling, the addition of 1 gramme of ammonium molybdate and further boiling for one and one-half minutes will produce a white precipitate if arsenic acid is present. The reaction is said to indicate the presence of 0.002 gramme of arsenic acid in a large amount of phosphoric acid.

Is Pellagra Caused by Rancid Fat?

Pixley (*Am. Journ. Clin. Med.*) reports six cases observations of which suggest that rancid fats may be the cause of pellagra. Corn and bacon were the chief articles of diet of those affected. "The cure of pellagra," says the author, "when it is regarded as the final stage of processes in the body due to chronic intoxication by rancid fats, is easy, but the consideration of resulting degenerations of liver, pancreas, heart, brain, and spinal cord, in long-standing cases, is another proposition."

Ozonin.

Ozonin, used for bleaching purposes, is prepared according to the *Pharmaceutische Post.* by dissolving 125 parts of rosin in 200 parts of oil of turpentine. This solution is mixed with a solution of 25 parts of potassium hydroxide in 40 parts of water and then with 90 parts of hydrogen dioxide solution. The jelly, thus obtained, becomes liquid when exposed to the light for a few days.

Poisoning by Melted Copper.

Hansen (*Metal. and Chem. Eng.*) reports a case of poisoning by melted copper. Five thousands pounds of electrolytic copper scrap—uncontaminated except for a small amount of admixed iron—were melted in a 3-phase arc furnace of the ordinary steel-furnace type, the experiment lasting some five hours. A few hours after pouring off all of the ten men in the furnace building suffered inconvenience in breathing. For the twenty-four ensuing hours severe nausea was experienced in each case, and a soreness throughout the entire system similar to that of acute grippe. Since in all other respects the run resembled an ordinary steel run, the trouble is attributed to copper which was shown to be present in the furnace fumes. The temperature of the copper bath as a whole at no time exceeded 1300°C. , so that probably the copper was volatilized only at points directly beneath the electrodes. From the severity of the attack, coupled with the short time the men were exposed to the fumes, and that in a building which was well ventilated, the author is of opinion that very serious results might obtain under less favorable conditions. In five years of continuous research work on a large scale with furnace processes which involved, among others, tellurium, tellurides, arsenic, arsenides, zinc and sulphite ores, the only physical inconvenience suffered has been an occasional carbon monoxide headache.

Vitality of Cholera Bacilli in Sea-Water.

The *Revista de Sanidad Civil* gives the following report by Jacobson on the vitality of cholera bacilli in sea-water. During the last cholera epidemic in St. Petersburg the water of the river Neva was contaminated to such a degree that it was feared that the towns on the coast near the mouth of the river might come into grave danger of being infected, as the author had found by numerous experiments that cholera bacilli can live in sea-water for forty-seven days. Jacobson further points out that such contaminated sea-water should never be used as ballast for vessels on account of the danger for the port of destination and the impossibility of thoroughly disinfecting such large quantities of water.

Oil of "False Camphor."

The essential oil of the "false camphor" tree a plant of unknown origin, has been examined by Semmler and Zaar (*Berichte*). It is a light yellow liquid, has the specific gravity 0.958 and is soluble in 2.5 volumes of 70 per cent. alcohol. It contains in addition to *d*-limonene and cineol a monocyclic aldehyde $\text{C}_{10}\text{H}_{14}\text{O}$, which is identical with *d*-perillic aldehyde. Besides this aldehyde, a di-cyclic aldehyde could be separated, which is identical with nyrtetral, a compound which has never before been isolated from an ethereal oil.

Reactions of Iodoform.

On adding to a solution of iodoform in a large excess of chloroform a crystal of lead nitrite a red color is produced at once in the mixture according to Oeschne de Comiak (*Journ. pharm. chim.*). When chloroform is replaced by bromoform no red color is produced by lead nitrite in the cold; on warming, however, the mixture acquires a wine-red color, which turns to garnet-red and finally to red-brown.

Electricity in Wood Alcohol Blindness.

Ziegler, in a paper read before the Medical Society of Pennsylvania, reports a case of wood alcohol blindness in which much improvement had followed treatment by "negative galvanism." There was a history of sudden total blindness following the use of a beverage which, as indicated by this symptom, contained wood alcohol. Loss of vision was total and had remained so for two weeks. The patient was given small doses of thyroid extract for its alterative and eliminating effects, and negative galvanism recommended, the trial to continue for a month. From failure to observe any result, the author was about to dismiss the case, when a slight response to the test for vision encouraged him to continue. After nine months' treatment vision had been improved to two-fifths of normal, and improvement was increasing at the time of the report.

Different Kinds of "Scarlet Red."

It is stated in *Merck's Report* that a number of cases have been reported in which the dye scarlet red has been dispensed when the physician had intended to prescribe the medicinal Biebrich scarlet R. "Chemically," says the *Report*, "the dye scarlet red is the sodium salt of amidoazobenzeneazobetanaphtholdisulphonic acid and is quite distinct from the Biebrich scarlet red medicinal, occasionally called fat ponceau and known chemically as amidoazotolueneazobetanaphthol. It would be well, therefore, for the physician always carefully to specify 'Biebrich scarlet red, medicinal.'"

Estimation of Ozone.

Ozone is generally estimated by conducting the mixture of gases under examination through neutral potassium iodide solution and titrating the liberated iodine with thiosulphate solution. Lechner (*Zeit. Electrochem.* through *Chem. Zeit.*) found that when this process is employed small amounts of iodine are carried away by the current, necessitating the use of absorption flasks. When the gas is conducted through an alkaline iodine solution, the iodine is converted into iodate, from which it can easily be liberated by acidifying and titrated in the usual way.

Value of Long-Continued Artificial Respiration.

Inglis has reported in the *Lancet* a case of recovery from aconite poisoning in which in addition to the customary antidotal treatment, artificial respiration was kept up unceasingly for six hours. The patient had accidentally taken a quantity of aconite liniment roughly estimated as sufficient to kill six persons; so it seems to us proper to give much credit for the recovery to the persistence in artificial respiration.

Meliatin, a Glucoside in Buckbean Leaves.

Meliatin, a glucoside isolated by Bridel (*Compt. rend.*) from buckbean leaves, occurs as colorless and tasteless crystals, with a bitter taste. It possesses the formula $\text{C}_{15}\text{H}_{22}\text{O}_9$, melts at 222°C. , and has a specific rotation of $81^{\circ}96$. It does not reduce Fehling's solution and is not precipitated by gallic acid or tannic acid. Emulsin splits up the glucoside into a substance of the formula $\text{C}_9\text{H}_{12}\text{O}_7$ and *d*-glucose.

The Modern Materia Medica.

Aponal, a new hypnotic, is prepared by the action of urea hydrochloride on amylene hydrate.

Brand liniment (liniment for burns), Dr. Muench, contain boric acid, solution of aluminum acetate, lime water and liquid vasenol.

Bromoplast is the name for a zinc caoutchouc plaster.

Brom-Somnisan is *somnissan* (a percolate of valerian) containing 10 per cent. of Erlemeyer's mixture of bromides.

Buffle's Eye Wash seems to be fennel water.

Chinatrocine Asthma Spray is said to contain the fluidextracts of coca, belladonna, cannabis, stramonium, grindelia, and snake weed, and potassium nitrate and cherry laurel water.

Chloralum is the name for a solution of aluminum chloride.

Crolas is a name for a "tasteless" castor oil.

Diguajakol is methylene diguaiacol.

Dominique-Dufour's Hair color contains considerable quantities of para-phenylene diamine the application of which is likely to cause severe dermatitis.

Eucadol occurs as a thick liquid, resembling beechwood tar, but possessing only slight aromatic odor.

Eunalin is the name for a product prepared from suprarenal glands.

Glutannin is a combination of vegetable albumin and tannic acid. It is marketed in the form of tablets and as powder.

Guipsine is the name for lozenges containing the "active principles" of mistletoe.

Hyccyan is the name of tablets of mercury cyanide.

Hymosa, exploited for the treatment of rheumatism, is said to contain salicylic acid, sodium salicylate, potassium iodide, extractive matter and alcohol.

Iodocitin is the name for tablets containing iodine "organically combined with lecithin and albuminoidal substances."

Kalmopyrin, advertised as a remedy for neuralgia, rheumatism, etc., and as a general antipyretic is described as "calcium acetyl-salicylate." It occurs as a white non-hygroscopic odorless powder which is easily soluble in water. Solutions of this salt should be freshly prepared as they are liable to undergo rapid decomposition.

Kranit pastillen is the name for pastilles said to contain "metaloidal" phosphorus.

Kreosolid, a substitute for creosote, can be considered as the magnesium salt of the diatomic phenols of creosote.

Lain is an ointment containing zinc oxide and naphthalin.

Lazarol is said to contain acetic acid, acetic ether, ethereal oil, glycerin, quinosol, alcohol and water.

Lecicarnin is said to contain lecithin, albumin and meat juice.

Lecithonil is a lecithin elixir, the precise composition of which has not been made public.

Lupina Powder, advertised as a remedy for hyperacidity of the stomach, is said to be a mixture of extract of condurango, citric acid, pepsin, magnesium oxide, magnesium dioxide, cane sugar, milk sugar, starch, and menthol.

Maculanin is said to be potassium amylate.

Medol is a creolin liniment for veterinary purposes.

Nervan is the name for tablets containing pyramidon and caffeine citrate.

Neurocine Prunier, put forward as a remedy for general debility, anemia, phosphaturia, etc., is calcium glycerophosphate.

Orthonal, a new local anesthetic, is said to contain cocaine, alypin and adrenalin in physiological salt solution.

Pancril is a combination of enzymes said to be capable of digesting starchy, fatty and albuminous food. It is supplied in the form of chocolate-coated tablets.

Parfueseptol is a disinfectant containing phenol and naphthalin-like products.

Perulin is the name for an ointment said to contain zinc oxide, paraffin, Japan wax, Peru balsam, lead acetate, phenol and wool-fat.

Purgolax is the name given to fruit pastilles containing phenolphthalein.

Reihseur Ointment Sticks consist of cacao butter, petrolatum and tannic acid.

Silva Tea No. 1 is said to consist of oak bark, and **Silva Tea No. 2** is said to contain bean leaves, fumatory, red chick weed, snake root, calamus, liverwort, dandelion, orange leaves, couch grass, yarrow, centaury, walnut leaves, horse-tail rush, chicory and oak bark.

Thyreath Tablets contain an extract of the thyroid glands of the calf.

Thyrochrom is an alcoholic extract of the thyroid gland of the calf. It is said to be an improvement on the thyroid preparations at present in use.

Turiopin for the treatment of catarrh of the throat, etc., is an alcoholic extract of the sprouts of pines, evaporated in vacuo.

Tussiva, exploited as a remedy for cough and catarrh of the throat, is said to contain in addition to sugar, glycerin, ammoniated spirit of anise and emulsion of almond oil, a fluidextract prepared from chestnut leaves, marshmallow root, ipecac, pimpinella and senega.

Util, for the treatment of herpes, is a suspension of yellow wax in alcohol. It is perfumed with musk.

Valyfen is the isovalerianic acid ester of fenchyl alcohol.

Vao-Fotsy Tea, for the treatment of febris biliosa and hemaglobinuria, is said to consist of the "leaves of *aphloia theaeformis*, a Madagascan tree."

Varalletes Bishop are effervescent tablets containing antipyrin, lithium citrate, peperazin, sodium bromide, etc.

Vin Urane (Pesqui) is a wine containing uranium nitrate, exploited as a remedy for diabetes.

Westrosol, is another name for trichlorethylene.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Saturated Solution of Boric Acid.—E. H., Massachusetts, writes: "Please tell me how boric acid you would use to make a 4-ounce saturated solution and how much it should measure?" With the exception of the omission of the word "much" between "how" and "boric," and its failure to indicate what the solvent is to be, or the temperature of that solvent, and the doubt as what kind of ounce is meant, this query is a very plain one indeed. But we can supply the "much," guess that U. S. P. water at 25° C. is the solvent to be used, and deduce from the context that some kind of an ounce by weight is meant, and then go ahead. Just for a starter we shall assume that the ounce is of the troy or apothecaries' variety, and therefore is the equivalent of 480 grains.

These comments are not made for the purpose of humiliating our querist, who is nameless here, but in order to emphasize the kind of thing that a query editor continually finds himself "up against."

By referring to the Pharmacopœia we find that boric acid is soluble in 18 parts of water at the stated temperature. Then, by a very simple arithmetical calculation we ascertain that if 1 part of boric acid and 18 parts of water, making a total of 19 parts, weigh 480 grains, then the 1 part of boric acid weighs approximately $25\frac{1}{4}$ grains, and the 18 parts of water weighs approximately $454\frac{3}{4}$ grains.

Just how much this solution would measure can be ascertained only by measuring it. By referring again to the Pharmacopœia we find that $454\frac{3}{4}$ grains of water measures 1 fluid ounce. This being the case, the $454\frac{3}{4}$ grains used to dissolve the boric acid would measure almost exactly the same. We do not know how much this volume would be increased by the addition of $25\frac{1}{4}$ grains of boric acid: as we have just said, the way to find out is to measure it. A note on the mathematics of solution in last month's CIRCULAR, page 569, may prove of some interest in this connection.

Books on Pharmacy.—McG., Vermont.—The book you have in mind is Principles of Pharmacy, by Prof. H. V. Arny, published by W. B. Saunders Company, Philadelphia, price \$5. Other works of a somewhat similar nature are the Practice of Pharmacy, by Prof. J. P. Remington, published by the J. B. Lippincott Company, Philadelphia, price \$6; and a Treatise on Pharmacy, by Prof. Charles Caspari, Jr., published by Lea & Febiger, Philadelphia, price \$4.25. Among the smaller books on the subject of pharmacy may be mentioned a Manual of Pharmacy and Dispensing, by Prof. A. B. Stevens, Lea & Febiger, \$2.50; a Compend of Pharmacy, by Dr. F. E. Stewart, P. Blakiston's Son & Co., Philadelphia, \$1; and Prescription Practice and General Dispensing, by Prof. J. H. Beal, Scio, Ohio, \$1.50. The Art of Compounding, by Prof. W. L. Scoville, published by the Blakistons at \$2.50, is a book of a nature somewhat different from that of the treatises on pharmacy men-

tioned and is supplementary to any of them. No matter which of the other books he has, no dispenser can afford to try to do without this one. A similar work designed for British pharmacists is the Art of Dispensing, which is imported by McKesson & Robbins, of this city.

Solution of Magnesium Citrate that Will Keep.—Z. A. H., Ohio.—Perhaps more ink has been shed over this preparation than any other in the Pharmacopœia. It became official in 1850, and every time the Pharmacopœia has been revised since then some change has been made in its formula.

To prepare a solution "so that it will keep for at least a week" instead of getting sour and showing a scum, as you say yours does, should not be a difficult task. In a paper read at the 1910 meeting of the American Pharmaceutical Association, J. K. Thum, of Philadelphia, stated that he considered the question of the deterioration of this preparation to be a bacteriological one, and told how he sterilized his materials and bottles by the use of boiling water. His directions for carrying out the process appear in the CIRCULAR for February, page 80. In the issue for January, 1909, page 24, R. P. Daniel, of Texas, outlined a similar process which enabled him to keep the solution for upwards of two months.

A time-saving way of making the solution is described by F. E. Dudman in the CIRCULAR for August, 1908, page 380, and several notes on preparing it, with especial reference to using a filtering process, by various contributors appear in the issue for April, page 311; May, page 367; and June, page 417, all for 1907. Perhaps one of the most exhaustive studies of the question which has been published in the CIRCULAR is that by the late Luther F. Stevens. This appears in the issue for November, 1889, page 245, and an abstract of it may be seen in the number for August, 1906, page 190.

One of our contributors who has a large trade in this solution says that it should be made up twice a week and all old stock on hand destroyed when the new is made.

Meaning of "aa. q.s. ad."—H. R. D., New York, disagrees with us as to the meaning of "of each" as expressed in a note headed "A Question of Liquidity" in the CIRCULAR for last month, page 565. The portion of the prescription which gave rise to the statement with which our correspondent disagrees, reads: "Aq. rosæ, liq. calcis, aa. q.s. ad $\bar{z}$ ij." We said that a strict construction of the direction would lead to the dispensing of a 6-ounce mixture, although we added that what the prescriber probably intended was a 3-ounce mixture. We based our statement on the literal meaning of the words, that is to say "take of each" of two liquids, "enough to make 3 ounces." "Of each, enough to make 3 ounces" means of rose water enough to make 3 ounces, and of lime water enough to make 3 ounces, which would be 6 ounces, unless, since we are so technical, a deduction is made for the amount of space that is occupied by the solids when we measure the second 3 ounces.

Egg Substitutes.—R. M. G., Maryland.—These, we believe, consist principally of starch, colored yellow, and, like other fakes, are a good thing for druggists to advise their customers to steer clear of.

Rolling Skin Cream.—H. K. C., Maryland, wants a formula for a "rolling out" massage cream similar to a well-known preparation on the market, but stipulates that he does not want a "formula made from milk, as it is too much trouble to make it in that way." We believe the well-known cream in question contains a milk product, and we further believe that to make an equally good one of the same type any other manufacturer must go to as much trouble as does the original maker. However, if he does not wish to use milk in the process of obtaining casein, our querist might buy his casein ready made, and then adapt the following formula to his purpose:

Casein (moist).....	3 ounces.
Boric acid.....	5 drams.
Cacao butter.....	2½ drams.
Carmin solution.....	enough.
Perfume	enough.

A formula of a different type, in which casein is not called for, is given below:

Stearic acid.....	20 parts.
Distilled witchhazel water.....	100 parts.
Sodium carbonate.....	3 parts.
Water, enough to make.....	200 parts.
Glycerin	3 parts.

Melt the stearic acid on a water bath; dissolve the sodium carbonate and glycerin in 60 parts of water and add gradually to the stearic acid; heat for about an hour with stirring from time to time. Then weigh and add water to make 100 parts. Heat for about a minute or until smooth, and add the witchhazel water. Again heat for a few minutes until smooth and beat with a rotary egg beater until nearly cold.

"It is my impression that if the witchhazel water be soaked overnight with flaxseed until thickened and then strained that it would be an improvement," says a correspondent, who adds: "The glycerin might be omitted with advantage as one of the 'original greaseless creams' ('Made in Great Britain') bears a label on which appears, 'Warranted free from glycerine.' Glycerin does not mix well with the sodium stearate and only by vigorous beating can it be kept well mixed."

To replace glycerin in creams of this type, German authorities suggest a thin agar-agar jelly.

Hair Grower.—M. B., New York, asks for a formula for a hair tonic that will (1) make hair grow, (2) prevent the hair from falling out, and (3) make the hair glossy and soft. By giving him such a formula, he says, we will help him to earn his bread.

A man with a formula of that kind would not have to stop at bread, but could begin his dinner with anchovies and caviar and go through the entire seven, seventeen or fifty-seven courses, with a different wine for each course. We have not such a formula and do not know of any such preparation as our querist specifies.

Coloring White Celluloid Blue.—J. M. S., New York.—The best time to color celluloid is when it is in the making, but white celluloid articles may be dyed with anilin. For this purpose the experts in the establishment of H. A. Metz & Co. say that "spirit blue R" and "spirit blue green" are as well adapted as any anilins.

Rubber Cement.—J. H. L., New York.—Pieces of rubber may be united by means of the pasty mass obtained by dissolving pure rubber in ether, benzin, carbon disulphide, or oil of turpentine. However, it is difficult to dissolve rubber satisfactorily on a small scale, and dangerous to handle most of its solvents, and as the cement may be bought ready made at a low price, we do not advise promiscuous experiments in making it. Those who wish to try it will probably succeed best by cutting pure, unvulcanized rubber into very thin slices, boiling it in water so as to soften and expand it, and then digesting it in benzin or hot oil of turpentine. Several days are required to effect the solution. When this cement is used for uniting pieces of rubber, the surfaces which are to be joined must be fresh; they should therefore either be pared with a knife or rasped with a file. They may then be coated with the cement, pressed firmly together, and exposed to a gentle heat for a few days.

Here is another formula, or, perhaps better, a modification of the first one: Virgin rubber is cut with a wet knife into the thinnest possible slices, which are then divided by shears into threads as fine as small twine. A small quantity of the shreds (say 1/10 of the capacity of the bottle) is then put into a wide-mouthed bottle, and the latter is three-fourths filled with benzin of good quality, and perfectly free from kerosene. The rubber almost immediately commences to swell, and in a few days, if often shaken, it will assume the consistency of honey. Should it be inclined to remain in undissolved lumps, more benzin must be added. Thinness may be corrected by adding more rubber. A piece of solid rubber no larger than a walnut will make a pint of the cement. It dries in a few minutes, and, by using three coats in the usual manner, leather straps, patches, rubber soles, backs of books, etc., may be joined with great firmness.

Liquid Nail Polish.—H. L. S., California.—From a previous number of the CIRCULAR we copy the two formulas which follow, and trust one or the other of them, or perhaps a combination of the two, will aid you:

I.

White wax.....	1 ounce.
Cottonseed oil.....	2 ounces.
Carmin	5 grains.
Oil of rose.....	5 drops.

Melt the wax, add the oil, triturate the carmin to fine powder, mix intimately with the melted fats, and then incorporate the oil of rose.

II.

Eosin	10 grains.
White wax.....	½ dram.
Spermaceti	½ dram.
Soft paraffin.....	1 ounce.
Alcohol	enough.

Dissolve the eosin in as little alcohol as will suffice, melt the other ingredients together, add the solution and stir until cool.

Straw Hat Cleaners and Bleachers.—G. A., Massachusetts.—Directions for cleaning, bleaching and varnishing straw hats are given in the CIRCULAR for May, 1910, page 233.

Spirit Gum.—H. L. S., California.—This adjunct of the buskin and wig is as variously constituted as is the cream used in removing it from the face. In its simpler forms spirit gum is a (1) solution of mastic in ether; (2) a solution of mastic in alcohol; (3) a solution of sandarac in ether; (4) a solution of shellac in alcohol; (5) any one of these "gums" in any one of the solvents. First among the more complex spirit gums are solutions of two or more of the hereinbefore mentioned "gums" in one or another of the solvents referred to, or in combinations of both. Then come flexible collodion, and liquid court plaster. The most complicated formulas are something after the following:

I.	
Mastic	2 grammes.
Sandarac	4 grammes.
Rosin	12 grammes.
Ether	2 grammes.
Alcohol	16 grammes.

II.	
Rosin, pale.....	4 grammes.
Castor oil.....	1 gramme.
Alcohol	16 grammes.

III.	
Sandarac	2 grammes.
Shellac	1 gramme.
Mastic	1 gramme.
Elemi	4 grammes.
Venice turpentine.....	1 gramme.
Alcohol	20 c.c. (mils)
Ether	5 c.c. (mils)

Stamping Ink.—F. E. Y., Ontario.—We suggest that you might be able to make a satisfactory ink for use with steel dies by experimenting with some of the following formulas:

I.	
Oleic acid, purified.....	5 parts.
Castor oil.....	55 parts.
Oil-soluble anilin black.....	3 parts.

By using other anilins, red, blue, violet, etc., inks may be produced, although as the tinctorial power of some of these colors is greater than that of the black dye, suitable allowance must be made in deciding upon the proportions.

II.	
Dissolve 1 part of asphalt in 4 parts of oil of turpentine and add enough lampblack to bring the solution to the proper consistency.	

III.	
Copaiba	9 ounces.
Lampblack	3 ounces.
Indigo	3 drams.
Prussian blue.....	5 drams.
Indian red.....	¾ ounce.
Dried yellow soap.....	3 ounces.

IV.
Heat 100 parts of olein to 80° C. and dissolve in it 1 part of oil-soluble anilin black.

For additional information on this subject you should refer to the issues of the CIRCULAR for May, 1907, page 360, May, 1906, page 175, and June, 1906, page 210. A note in the issue for last September, page 478, may also prove of value in this connection.

Fluidextract of Cannabis Indica in an Aqueous Mixture.—B. B., Ohio, asks for a "working method for preparing the following formula," his difficulty being to get the "prescribed amount of cannabis indica to remain in solution":

Heroine hydrochloride.....	⅓ grain.
Tartar emetic.....	⅛ grain.
Fluidextract of cannabis indica....	7½ minims.
Fluidextract of lobelia.....	7½ minims.
Chloroform	4 minims.
Syrup of tolu.....	enough to make 1 ounce.

Our correspondent does not say whether or not this is a physician's prescription. To us it has the appearance of a physician's supply house label.

Pharmaceutically the mixture is a disgrace, and therapeutically it is dangerous, because sufficient of the tartar emetic to do harm in the last dose may be precipitated by the alcohol in the fluidextracts, and sedimentation may carry down a toxic dose of the alkaloidal salt. If the mixture is prescribed by a physician we should acquaint him with its harmfulness. If it is not a prescription we should not have anything to do with it, beyond pointing out to the one presenting it, its possibilities for doing harm.

Compound Syrup of Ipecac, French Codex.—S. P., Pennsylvania.—The official formula for sirop d'ipécacuanha composé is as follows:

Ipecac root, contused.....	30 grammes.
Senna leaves.....	100 grammes.
Wild thyme (thymus serpyllum)	30 grammes.
Red poppy flowers.....	125 grammes.
Magnesium sulphate.....	100 grammes.
White wine.....	750 grammes.
Orange flower water.....	750 grammes.
Boiling distilled water.....	3,000 grammes.
Sugar	enough.

Macerate the ipecac and the senna in the wine for twelve hours; squeeze through a straining cloth, and filter; to the residue, add the thyme and the poppy flowers; pour the boiling water over this mixture and allow it to stand for six hours; then squeeze it through a straining cloth. Dissolve in the liquid thus obtained the magnesium sulphate; add the orange-flower water, and filter. Mix with the vinous liquid. In the mixed liquids dissolve on a water bath, sugar in the proportion of 180 grammes to each 100 grammes of liquid. Strain.

Essence of Jamaica Rum.—C. R., New Jersey.—Ethyl butyrate is the principal aromatic constituent of Jamaica rum, and is used in simulating rum in flavoring comestibles and beverages.

However, the use of the artificial flavorings is scarcely to be condoned even on the ground that the natural flavoring is an intoxicating liquor. Usually the artificial concoction contains more alcohol than the natural, and the well-meaning but unenlightened users of the substitute who would not countenance the use of the natural rum are hoodwinking themselves. That other practice of disguising diluted alcohol with various essences for the purpose of palming it off as a distilled liquor is, in common with all other forms of out-and-out cheating, so reprehensible that no druggist worthy of the name has for it anything but outspoken condemnation.

Saratoga Ointment.—F. R. S., Iowa.—In reply to published requests for information concerning this preparation we have received from the Milo J. John Company, Iowa, the following formula, which it says is used by some of the physicians of Clinton, that State:

Powdered boric acid.....	30 grains.
Zinc oxide.....	60 grains.
Oil of eucalyptus.....	15 drops.
Petrolatum.....	enough to make 480 grains.

Cecil D. Cook, Ontario, writes that a large manufacturing concern of his acquaintance uses the formula which appears below:

Powdered boric acid.....	5 drams.
Zinc oxide.....	10 drams.
White petrolatum.....	4 pounds.
White wax.....	1 ounce.
Spermaceti.....	1 ounce.
Eucalyptol.....	2 ounces.

Melt the wax, spermaceti and petrolatum together, and as it cools, sift in the zinc oxide and boric acid, using a No. 90 sieve. Finally, add the eucalyptol as the mass becomes cooler, and stir until it sets.

An old Pennsylvania friend who expresses his belief in the reciprocal principle, and requests that his name be not used, says that "the secret of successful ointment-making lies as much in the mechanical details as in the careful choice and proportion of the ingredients." He adds that "to attain smoothness it is quite essential that the product be carefully milled." Ointment mills of various sizes are on the market. As a formula he suggests the following:

White petrolatum.....	40 pounds.
Paraffin (120° m. p.).....	2 pounds.
Zinc oxide (pure).....	5 pounds.
Boric acid.....	5 pounds.
Eucalyptol.....	4 fl. ozs.

Melt the petrolatum and the paraffin together, sift in the powders, stir well together and add the eucalyptol. Allow to congeal, and mill carefully.

The proportion of paraffin should be increased in warm weather.

We are also under obligations to Elias Shaller, New York; F. B. W., Massachusetts; and F. H. Webb, Ontario, for help in this connection, and to all our friends who manifest this give-and-take spirit we extend our thanks.

Making Compound Solution of Cresol.—F. B. W., Massachusetts, writes that he experiences no difficulty in producing a compound solution of cresol that will mix clear with water in any proportion. He describes his process as follows:

I warm the linseed oil in a capacious casserole or a deep earthen jar, placed in a water bath, add the potassium hydroxide, and mix thoroughly; next add 30 c.c. (mils) of alcohol for each 1000 grammes, mix thoroughly and continue the heat without further stirring until the oil is saponified; this is determined by the absence of oily drops when a little of it is mixed in hot water, in a test tube. By this time all the alcohol has evaporated and a perfect soap is formed. Then I add the cresol gradually and enough water to make the required quantity. When made in this way the preparation will mix with water in all proportions, making perfectly clear solutions.

We thank our correspondent for his note and should be glad to publish his name, but for the fact that he has indicated a desire to remain anonymous.

Almond Creams and Lotions.—M. B., New Jersey.—We do not know the composition of the proprietary article you mention, but quite a number of formulas for preparations of this class appear in back numbers of the CIRCULAR, as anyone may see for himself by using the monthly and annual indexes. Herewith we reprint one of these formulas:

Honey and Almond Lotion.

Ointment of rose water (U. S. P. 1900).....	25 grammes.
Glycerin.....	25 c.c. (mils).
Expressed oil of almonds....	25 c.c. (mils).
Solution of sodium hydroxide (U. S. P.).....	60 c.c. (mils).
Mucilage of quince seed (1 to 64).....	125 c.c. (mils).
Oil of bitter almonds, essential, and oil of rose.....	enough to perfume.
Water.....	enough to make 1,000 c.c. (mils).

Triturate in a cold mortar the ointment of rose water, the expressed oil of almonds and the solution of sodium hydroxide until a smooth emulsion is obtained. Add the mucilage in divided portions, with constant trituration; likewise add the glycerin, and, continuing the trituration, 500 c.c. (mils) of water. Transfer the mixture to a bottle, add the perfume and enough water to make 1,000 c. c. (mils), and shake thoroughly.

In order to make the preparation true to label honey may be used in place of some of or all the glycerin.

Perhaps by replacing a small part of the almond oil with castor oil, a somewhat pearly appearance may be obtained.

Venice Lime.—In further answer to B. E., New York, P. K. Hildmann, New York, favors us with the following note:

In regard to the article on "Venice Lime," in the CIRCULAR for October, page 568, I beg to add a little more light. There is no doubt that your New York friend, B. E., had received numerous calls for "Wiener kalk," particularly from his German customers. This article is a mineral obtained chiefly in the province of Kieder-Oesterreich, lower Austria, with the city of Vienna, or Wien in German, as its capital. Chemically it consists mainly of calcium carbonates and magnesia, and after being burned or dried, the pulverous form is marketed under the name of Wiener kalk (Vienna lime), and is used as a polish.

In satisfying the demand of my customers for Wiener kalk I believe myself to be right in supplying them with bolted gilder's whiting, and I have never had any dissatisfaction.

We are under obligations to Friend Hildmann for this note, and trust that he, and all others who like him may be able to help us in answering queries, will write to us as often as occasion arises. This is a give-and-take department, and we wish that everyone who takes anything from it would give something to it.

Compound Syrup of White Pine with Tar.—F. A. L., Florida.—Compound syrup of white pine is an official preparation, the formula for which may be found in the National Formulary. Glycerite of tar is another N. F. preparation, and may be added to the compound syrup in the proportion necessary to make the mixture represent the dose of tar desired by the prescriber.

Saponified Phenol Disinfectant.—E. T. G., Michigan.—The United States department of agriculture issued several years ago a booklet on the "Animal Parasites of Sheep," in which are given formulas for various liquids to be used as sheep-dips, including coal-tar preparations of the nature desired by you. Doubtless a copy of this booklet may be obtained from the secretary of agriculture. In the CIRCULAR for April, 1904, page 84, is to be found an article based upon this booklet. The formula for one of the coal-tar dips was reprinted in the CIRCULAR for May, 1909, page 242, and is as follows:

Soap	1 pound.
Crude carbolic acid.....	1 pint.
Water	50 gallons.

Dissolve the soap in a gallon or more of boiling water, add the acid, and stir thoroughly. Finally add the remainder of the water.

The following formula has been approved by the British imperial board of agriculture:

Liquefied phenol (97 per cent.)..	60 ounces.
Good soft soap.....	5 pounds.
Water.....	enough to make 100 gallons.

Dissolve the soap in the phenol with the aid of a gentle heat, and mix with enough water to make 100 imperial gallons.

Here is another formula from a British source:

Zundel's Carbolic Dip.

Crude carbolic acid.....	2 pounds.
Caustic lime.....	2 pounds.
Caustic potash.....	2 pounds.
Soft soap.....	6 pounds.
Water	70 gallons.

About Basham's Mixture.—C. T. Heseltine, Maine, supplements the note on preparing Basham's mixture by J. J. Davies, appearing on page 568 of last month's CIRCULAR with the following:

For Basham's mixture I use 8-ounce glass-stoppered perfume bottles containing the several ingredients separately, and keep them together so that no time is wasted traveling around the store; and I also have the fresh preparation at once.

We appreciate this opportunity of thanking Mr. Heseltine for his fraternalism, and hope that he will frequently lend aid to his fellow-pharmacists through these columns.

In passing we are led to remark that short-cuts in the making of Basham's mixture have all too frequently in our experience resulted in the return of the mixture with a precipitate. We are inclined to distrust the stability of ammonium carbonate as such or in solution; and our method of getting around the uncertain alkalinity of this salt which is usually responsible for the rapid deterioration of the mixture is to add enough ammonium carbonate to the diluted acetic acid mixed with sufficient water to make 500 c.c. (mils) (in the official quantity) to make the solution neutral to litmus; and then add a drop or two of the diluted acid. Basham's mixture made in this way has, as an experiment, been known to stand on a drug-store shelf in a loosely cork-stoppered bottle for several months without losing any of its transparency or forming any precipitate. It may take a few minutes longer to fill a prescription for liquor ferri et ammonii acetici by our method, but, once filled, it may be forgotten for it never comes back full of "brick dust."

Culinary Gelatin.—P. A., New York, writes: "I should be pleased to find how the various gelatins on the market are made more easily and quickly soluble. Also how they are flavored."

We take it that P. A. has reference to the so-called "jelly powders" which are not entirely composed of gelatin, the following being a typical formula:

Powdered gelatin.....	2 parts.
Powdered sugar.....	7 parts.
Powdered tartaric acid.....	1 part.
Oil of lemon.....	enough.

It is quite plain that the solubility of such a mixture will be greater than the solubility of an equal bulk of gelatin. Market varieties of gelatin are not all equally soluble and to secure a soluble sort it is necessary so to specify on orders—and then to prove it with a sample of the lot obtained.

The various flavors are imparted to the powders by means of essential oils or "fruit ethers." The flavoring material is first triturated with the powdered sugar.

Test for Bile in Urine.—J. H. S., New Hampshire.—The presence of bile in the urine is usually determined by a test for bile pigments. The most common of these tests is Gmelin's which consists in carefully overlaying a sample of the urine in a test tube with a little nitric acid to which has been added a trace of nitrous acid. By this test there is obtained at the juncture of the two liquids a series of colored layers in the following order from above downward: green, blue, violet, red, and reddish-yellow. For the test to be positive the green ring must be present and also the red, and at the same time. The reagent must not contain too great a proportion of nitrous acid, neither must there be any alcohol in the liquid. Gmelin's test is very sensitive, indicating the presence of 1 part of bilirubin in 800,000 parts of liquid.

Hammarsten says that Rosenbach's modification of Gmelin's test is simpler and more sensitive than the original. In applying this test the urine is filtered through a small white filter paper; and, when all has passed through, a drop of Gmelin's reagent is applied to the inside surface of the filter. A pale-yellow spot is formed which, if bilirubin is present, is surrounded by colored rings which appear yellowish-red, violet, blue, and green, from within outward.

For dark-colored urines or those containing indican or blood pigments, Hammarsten recommends Huppert's test. This consists in treating the urine first with solution of calcium chloride, and then with solution of sodium carbonate; collecting the precipitate on a filter; washing the precipitate with distilled water; dissolving it in alcohol containing 5 per cent. of concentrated hydrochloric acid; and heating this solution to boiling. A green or bluish-green color denotes the presence of bilirubin.

Cresol Disinfectant.—R. M. G., Maryland.—We do not know the formula of tarola, but suggest that you look over the Pharmacopœia and National Formulary, in which appear formulas for various cresol preparations; and you might well read the note on phenol disinfectants in the adjoining column.

Tasteless Compound Syrup of Cinchona.—F. A. L., Florida.—Hager gives the following formula for a syrup of cinchona which is really a compound syrup and, if not tasteless, at least has an agreeable savor:

Cinchona	4 parts.
Cinnamon	1 part.
Red wine.....	24 parts.
Sugar	32 parts.

The drugs, ground to the proper degree of fineness, are macerated in the wine for eight days; the liquid is strained off and filtered; and the sugar is dissolved in the filtrate.

The usual "tasteless syrup of quinine" is a preparation of quinidine, the National Formulary formula for syrup of quinidine being typical. In the issues of the CIRCULAR for April, 1910, page 171, and for January, 1910, page 23, are formulas for syrups for disguising the taste of quinine. These may be adapted as vehicles for mixtures of cinchona alkaloids.

Making Emulsions.—W. E. B., Maine, writes: "In making emulsions, say of castor oil, why is the water added all at once? In adding it slowly would it not emulsify as well?"

Emulsions depend upon two characteristics of liquids—surface tension and colloidal conditions. Density is also a factor, but has much less influence than either of the other two. In the case of oils and water, the oils have a much less surface tension than water, hence the globules of oil coalesce and refuse to emulsify until the surface tension of the water is reduced. Emulsifying agents, then, are bodies which reduce the surface tension of water without too greatly changing (or increasing) its density. Colloidal bodies possess this property in great degree, hence soaps or saponins, gums or mucilages and albuminous bodies rank (in about the order named) as the best or most potent emulsifying agents. But all colloidal bodies possess this property in a marked degree, and even insoluble colloids, as ferric hydroxide, copper hydroxide, calcium hydroxide, or any very fine or colloidal precipitate or body will act as an emulsifying agent. We have an illustration of these in kerosene emulsions, Bordeaux mixture, etc. And it is also true that weak solutions of crystalline salts, of alcohol or of other substances, which reduce the surface tension of water, also act, in a limited way, as emulsifying agents, whenever these do not unite chemically with the oils and thus restore the surface tension of the water.

Strong solutions of these soluble substances may act as dehydrating agents, or in other ways interfere with the emulsifying properties, and so will even break an emulsion already formed. Yet the fact remains, that weak solutions of these crystalline and soluble substances, whenever they reduce the surface tension of bodies, aid in forming as well as in maintaining emulsions.

Now, in pharmacy, considerations of therapeutic action, convenience, permanence and palatability all favor gums or albuminoid bodies as emulsifying agents, hence these are generally used. In using solutions of these—as mucilages, milk, eggs, etc.—it is found that emulsions form more easily when the oil is incorporated with strong solutions, since the enveloping of the oil globules in a membrane of colloidal solution is a second important factor in emulsions. Emulsions so formed are readily diluted and

the process is easier than if the diluted emulsion is attempted at one operation. Very strong emulsions can be made in this way—containing 60% to 90% of oil by volume.

In the case of dry gum (powdered), since acacia is soluble in about twice its weight of water, this proportion is found to work most easily in practice. Hence the Continental rule of oil 4, water 2, gum 1 (or its American modification of oil 4, water 1½, gum 1) is simply a rule of convenience. Just why a close adherence to these proportions makes a considerable difference in case of manipulation is not thoroughly understood, but that adherence is not positively necessary, is a fact. One can double or treble or even quadruple the proportion of water and still secure an emulsion with increasing difficulty and expenditure of time in manipulation, but still with comparative ease. In fact it is impossible to place any limits to the proportions in which an emulsion may be formed. In practice, the limits are set by considerations of time and effort, hence the simplest answer to your question is that the Continental rule is the most rapidly and easily followed, but that an equally good emulsion may be made by almost any method of mixing, provided a proper amount of skill and patience be used.

Olive Oil Soap of the Spanish Pharmacopœia.—C. H., Ohio.—In the issue of the CIRCULAR, for February, 1910, page 67, the following appears as a part of a note on the making of this article:

In the Spanish Pharmacopœia is a process for making olive oil soap, which is designed for the use of pharmacists. This follows:

Sodium hydroxide.....	18 grammes.
Sodium chloride.....	30 grammes.
Olive oil.....	100 grammes.
Distilled water.....	enough.

Dissolve the sodium hydroxide in 100 grammes of distilled water, mix the solution with the oil and heat moderately, without stirring, replacing the water lost by evaporation, for two hours or longer until saponification is complete. Add 300 grammes of distilled water and continue the heating until the soap is dissolved; stir in a solution of the sodium chloride in 100 grammes of water, and heat the mixture until the glycerin has separated. Set aside until the next day; separate the soap from the liquid; cut it into pieces; wash off with a jet of cold water and dry between absorbent paper.

Mist. R. & S. Co., Bellevue Hospital.—M. T., New York.—By turning to the Hospital Formulary of the Department of Public Charities and the Department of Bellevue and Allied Hospitals of the City of New York, which is a small book notwithstanding its title, we find the following formula:

Mistura Rhei et Sodæ Comp.
Comp. Rhubarb and Soda Mixture.

Sodii bicarb.....	gr. 160
Ext. ipecacuanæ fl.....	℥ 8
Ext. rhei fl.....	℥ 60
Tinct. nucis vomicæ.....	fl 3 3
Glycerin	3 4
Aquæ menthæ piperitæ.....	q.s. ad fl 3 4

It is there credited to the City Hospital.

We believe this to be the formula you require.

Artificial Apples for Jugglers' Use.—B. B., New York, writes: "Have been ordered by a juggler to prepare a round plastic mass the consistency and same characteristics of an apple, so as he can juggle same, and while the mass is in midair, cut same with a knife and catch both halves on a fork."

"Have tried numerous compounds and find that the best is—

Arrowroot 4 ounces.
Potassium hydroxide..... ½ dram.
Glycerin and gelatin..... enough to mass.

"The above preparation would be all right were it not for the fact that, when cut, the both halves are brittle around the edges and break off when caught on a fork.

"Kindly advise as to a better formula."

Not knowing what are embraced in the "numerous compounds" with which B. B. has experimented we hesitate to suggest a "better formula." Nevertheless we shall hazard the suggestion that the official glycerite of starch in which has been incorporated some white pigment made into a paste with glycerite of tragacanth, would probably be free from the objectionable tendency to harden and crumble.

On behalf of our querist we ask such assistance as our readers may be in a position to extend.

Elixir of Creosote and Heroine.—C. A. J., Pennsylvania.—After ascertaining from the physician the amount of creosote and heroine he wishes to have exhibited in each dose of the elixir and the size of the desired dose you might reach success along the following lines:

Apply the rule of three to determine how much heroine and how much creosote would be present in a pint of elixir containing these drugs in the desired proportion, then use this formula:

Heroine the determined amount.
Creosote the determined amount.
Glycerin 8 ounces.
Fluidextract of wild cherry..... 1 ounce.
Compound spirit of orange..... 2 ounces.
Alcohol 4 ounces.
Distilled water..... 1 ounce.

Mix the alcohol and the compound spirit of orange; dissolve the heroine and the creosote in this liquid; add the fluidextract and the glycerin; shake well, and add the water.

Multiple Incompatibility.—H. L. S., California, writes as follows:

Please criticise the following prescription as to its compatibility:

R Na Br..... grs.x.
Liq. pot. ars..... gtts.x.
Ess. pancreatin
Ess. pepsin..... aa ʒss.
Syr. rhei ar..... ʒj.
Aq. q.s. ʒiij.

I drew the doctor's attention to (1) the pepsin and pancreatin destroying each other; (2) the alkali of rhubarb incompatible with the pepsin; (3) tannin in rhubarb precipitates pepsin; and (4) mixture precipitated heavily.

Although H. L. S. has attended pretty well to the criticism of the mixture's lack of compatibility, he might further have enlightened the prescriber—who evidently needs enlightening—by stating the fact that Fowler's solution is decomposed by tannic acid, a precipitate being formed which is not easily diffused

and would probably all remain in the bottle until the last dose was poured out when it would doubtless cause untoward effects. If this prescription came to us, we should refuse to fill it and strongly endeavor to convince the prescriber that certain medicinal substances are more reliable and better appearing, hence more resultful physically and psychically, when exhibited in their simplest forms.

"Solution of Glycerophosphates of Lime and Soda."—C. A. J., Pennsylvania.—In the CIRCULAR for March, 1910, page 114, appears a formula for an elixir of glycerophosphates, which, as it calls for no sugar, might just as well be called a formula for a solution. It is here reproduced:

Sodium glycerophosphate.. 25.00 grammes.
Calcium glycerophosphate. 8.75 grammes.
Phosphoric acid..... 10.00 grammes.
Glycerin 240.00 c.c. (mils).
Angelic wine..... 300.00 c.c. (mils).
Alcohol 30.00 c.c. (mils).
Tincture of sweet orange
peel 100.00 c.c. (mils).
Water.... enough to make 1,000.00 c.c. (mils).

This formula was suggested to the Philadelphia branch of the American Pharmaceutical Association, by W. L. Cliffe, who remarked: "The present directions [those of the National Formulary] are satisfactory but the additional phosphoric acid is required by the glycerophosphates on the market. This preparation is smoother and more palatable than the one made from aromatic elixir."

We have not experimented with this formula. In our opinion, it is, in common with most others for similar preparations originating in this country, faulty, in that the use of phosphoric acid is directed. It is the careful endeavor of the manufacturer to remove all traces of this acid from the glycerophosphoric salts. We suggest that, after changing the quantities, if this be necessary to meet the requirements of the prescriber, you experiment with glycerophosphoric acid in lieu of the phosphoric acid, triturating the salts with the glycerin and about 200 c.c. (mils) of water, adding the acid (about 10 c.c. [mils]) and then the other ingredients.

Other notes on preparations of the glycerophosphates appear in the issues of the CIRCULAR for June, 1910, page 277; April, July, August and September, 1909, pages 173, 350, 405, and 457, respectively; and April and November, 1908, pages 182 and 554, respectively.

Unguentum Leniens.—P. P., District of Columbia.—This is the German official name for cold cream. The formula in the German Pharmacopœia is as follows:

White wax..... 7 parts.
Spermaceti 8 parts.
Almond oil..... 60 parts.
Water 25 parts.

To every 50 grammes of the ointment which has been stirred until foamy, 1 drop of oil of rose is added.

It is customary in this country for every ingredient to be set down in the formula proper, not for one or more of them to be mentioned for the first time in the directions. The German official book states that "cold cream is white."

Elixir of Hydrastis.—C. A. J., Pennsylvania.—You might experiment, with the official formula for glycerite of hydrastis, U. S. P., as a basis, using the following formula as a beginning:

Glycerite of hydrastis.....	500 c.c. (mils.)
Alcohol	200 c.c. (mils.)
Rose water.....	100 c.c. (mils.)
Oil of sweet orange.....	1 c.c. (mil).
Distilled water enough to make	1000 c.c. (mils.)

Dissolve the oil in the alcohol; mix with the rose water and 150 c.c. (mils) of distilled water; mix all with the glycerite; set aside for twenty-four hours; and filter.

This gives a preparation representing approximately 30 grains (the average dose) of hydrastis in each fluid-dram. Should the physician for whose use it is designed wish a different dose, the proportion of glycerite may be changed accordingly.

Of course, there is no reason why the elixir should not be made direct from the crude drug, if the operator prefers to make it that way.

Liquid Sulphur.—F. A. L., Florida.—We believe that all the characteristics and real virtues of a so-called "liquid sulphur" are possessed by the solution of sulphurated lime of the National Formulary. The official formula is as follows:

Lime, fresh slaked.....	165 grammes.
Sublimed sulphur.....	250 grammes.
Water [boiling], a sufficient quantity.	

Mix the slaked lime with the sulphur, and add the mixture gradually to 1750 c.c. [mils] of boiling water. Then boil the whole, under constant stirring, until it is reduced to 1000 grammes; strain, and having allowed the solution to become clear by standing in a well-stoppered bottle, decant the clear brown liquid, and keep it in completely filled and well-stoppered bottles.

You may in this connection find interesting a note on "Soluble Sulphur" which appears in the CIRCULAR for August, 1910, page 423.

Massage Cream.—C. B., California.—As you do not specify just what kind of a massage cream you want, and as there are several types, we can do no better than refer you to information we have already given on the subject. If we knew exactly the type of cream you wish to make we might be more specific in our reply.

Formulas for massage cream appear in the issues of the CIRCULAR for last month, page 612; May, page 257; and March, page 137. By referring to the annual index for 1910, we find about a dozen references to this subject, and the annual index for any one of several previous years shows as many. A note in the CIRCULAR for February, 1909, page 77, is particularly interesting in this connection, and the answer to another querist, on page 640, may be found helpful to you.

A Family-Medicine Tea.—C. P., New Jersey.—We have no knowledge of the composition of the nostrum to which you refer. We do know that many druggists find a profitable sale for St. Germain tea, the laxative species of the National Formulary.

Liquid Shoe Dressing.—G. A., Massachusetts.—A formula for such a preparation appears in the CIRCULAR for September, 1910, page 468.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Universal Balm.—G. F. D., Massachusetts.
Camphorated Rhubarb.—C. H. J., Maryland.
Mucol.—L. Y. L., Maine.
Tarola.—R. M. G., Maryland.
Atwood's Bitters.—M. B., New Jersey.

Corn Quieters.

Feet that have been frolicking in canvas slippers are very liable to protest against the hampering of leather-lined waterproof, thick-soled footwear which their owners begin to affect at this season. Hence the following may be helpful—to maker as well as user.

Corn Paint.

Salicylic acid.....	1½ ounces.
Pyroxylin	1 ounce.
Amyl acetate.....	5 ounces.
Acetone	15 ounces.
Balsam of fir.....	2 drams.
Castor oil.....	2 drams.
Oil of cloves.....	15 minims.
Make a solution.	

This should not be made or used near an open flame.

Anodyne Corn Remover.

Salicylic acid.....	2 drams.
Extract of belladonna.....	1 dram.
Powdered French rosin.....	½ dram.
Castor oil.....	1 dram.
Flexible collodion... enough to make	2 ounces.

Cream of Camphor.

The formula here presented is taken from a report to the Philadelphia branch of the American Pharmaceutical Association by a committee of which Dr. E. Fullerton Cook was chairman:

Castile soap.....	120 grains.
Ammonium carbonate in clear pieces	120 grains.
Powdered camphor.....	120 grains.
Oil of thyme.....	1 fl. dr.
Oil of turpentine.....	2 fl. ozs.
Tincture of opium.....	2 fl. drs.
Water..... enough to make	1 pint.

Dissolve the soap and the ammonium carbonate in 10 fluid ounces of water, and introduce the solution into a pint bottle. Dissolve the camphor in the mixed oils, and add to the soap solution, shaking the bottle vigorously until an emulsion is formed. Finally add the tincture of opium, and enough water to make 1 pint, and mix well by shaking.

Formulas for preparations of a somewhat similar nature may be seen in the CIRCULAR for September, page 476.

Eucalymol Mouth Wash.

Thymol	1 gramme.
Benzoic acid.....	12 grammes.
Oil of peppermint.....	2 c.c. (mils.)
Oil of gaultheria.....	1 c.c. (mil).
Tincture of eucalyptus.....	60 c.c. (mils.)
Alcohol	400 c.c. (mils.)
Distilled water. enough to make	500 c.c. (mils.)

Minnesota Board Questions.

Herewith are reprinted from the twenty-sixth annual report of the Minnesota Board of Pharmacy a sample set of examination questions used by the board. Other sets of questions asked by the Minnesota board appear in the issues of the CIRCULAR for January, 1906, page 24; and December, 1887, page 286.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Preliminary Examination.

1. Write ten words as dictated.
2. Give the meaning of the following words: (a) Force, (b) Colorless, (c) Storage, (d) Transparent, (e) Sufficient.
3. (a) Divide twenty four-thousands by sixteen-millionths. (b) Divide fifteen millionths by six-hundredths.
4. (a) From the sum of 27% and 20% take their difference. (b) From $\frac{3}{4}$ of $1\frac{1}{2}$ take 5-7 of 14-15.
5. (a) Multiply $30\frac{3}{4}$ by $6\frac{3}{4}$. Work out in fractions. (b) Divide 30.26 by 5.05. Do not convert to fractions, carry out two places.
6. (a) A cough mixture contains $\frac{1}{8}$ gr. Codeine Sulphate to the teaspoonful. The Doctor prescribes 4 oz. of this cough mixture and Aromatic Elixir using enough of each to make the dose of the Codeine Sulphate 1-12 gr. to the teaspoonful in the finished prescription. How much of the cough mixture and how much of the Aromatic Elixir should be used in the 4 oz. (b) How many capsules, 5 gr. each, can be filled from one ounce av. of Quinine?
7. A druggist buys a pound of Flex. of Cascara at \$2.25 less 40 per cent. At what price must he sell 1 oz. to make 100 per cent.
8. A sells 12 shares of stock to B for \$1,440.00. He made 20 per cent. on the sale. How much did he pay for 1 share?
9. At 10 cts. a glass what is the per cent. profit on a glass of Ice Cream Soda if 2 oz. of Ice Cream and 1 3-5 oz. of Syrup are used—Ice Cream costing 60 cts. a gallon and Syrup 25 cts. a qt., allowing $\frac{1}{2}$ ct. as cost of the Carbonated Water.
10. Write a short essay on "My Favorite Sport or Pastime."

Examination for Pharmacist.

Pharmacy.

1. Define the difference between (a) Maceration and Digestion; (b) Infusion and Decoction; (c) Emulsion and Mixture.
2. State how the following preparations are made: (a) Liquor Magnesii Citratis; (b) Unguentum Hydrargyri; (c) Tinctura Benzoini Composita.
3. (a) Explain the difference between Oleoresins and Fluidextracts; (b) Why are Fluidextracts the most consistent form of drugs to use?
4. Name the ingredients necessary to make the following preparations: (a) Compound Syrup of Sarsaparilla; (b) Fowler's Solution; (c) Solution of Lead Subacetate.
- (5) (a) What is Chloroform? (b) How is it prepared? (c) Describe its properties.
6. Give the common English names for the following preparations: (a) Aqua Amygdalae Amarae; (b) Hydrargyrum Ammoniata; (c) Liquor Ferri et Ammonii Acetatis; (d) Potassii et Sodii Tartras; (e) Spiritus Aetheris Compositus.
7. (a) Describe in detail the manipulation necessary to make Syrup of Ferrous Iodide; (b) How is the finished syrup preserved.
8. (a) Name the ingredients necessary to make Liquor Ferri et Ammonii Acetatis; (b) What precaution is necessary to prevent this from being an unsightly mixture?
9. Describe Granular Effervescent Powders and give general formula for their preparation.
10. (a) State how to prepare a Gum Resin Emulsion; (b) a Fixed Oil Emulsion; (c) a Volatile Oil Emulsion.

Chemistry.

1. (a) What is a Radical? (b) What is the Ethyl Rad-

ical? (c) What is the Methyl Radical? (d) What is the combining power of these Radicals?

2. (a) What are Aldehydes? (b) From what and how obtained?
3. How much Sulphuric Acid would be required to make 100 cc. Normal Volumetric Solution?
4. What reaction takes place in the manufacture of pills of Ferrous Carbonate? Also show by equation.
5. Complete the following equation: $2 \text{Fe}_2\text{SO}_4 + 6 \text{Mg} (\text{O H}) = ?$ Naming all members of the equation.
6. Would a stable Precipitate be produced by mixing Mercuric Chloride 6 gms., Potassium Iodide 25 gms., Water 500 cc. If so, describe the precipitate, and if not, what reaction does take place?
7. How could you distinguish between Solution of Tersulphate of Iron and Solution of Subsulphate of Iron by their reaction with Sulphuric Acid?
8. What is the difference between hard and soft water and what causes "temporary hardness" and "permanent hardness" in water?
9. What is the percentage of Sodium in $\text{Na}_2 \text{SO}_4 + \text{H}_2\text{O}$? Atomic weights, Na. 23, S 32, O 16 and H 1.
10. Describe the Leblanc process for the manufacture of Carbonate of Soda.

Botany and Materia Medica.

1. Give the medicinal use and dose of Acidum Benzoicum.
2. Give the official definition of Poke Root.
3. (a) Give the Latin name of Oil of Pennyroyal; (b) How is it obtained? (c) From what part of the plant is Oil of Thyme obtained? (d) What is another name for commercial Oil of Thyme?
4. From what are each of the following obtained? (a) Physostigmine; (b) Atropine; (c) Colchicine; (d) Hydrastine.
5. What are Latin names for the following: (a) Spearmint Water; (b) Syrup of Tar; (c) Milk of Asafoetida; (d) Blistering Collodion; (e) Eaton's Syrup.
6. What is the Latin name for (a) Javelle Water; (b) Dobell's Solution.
7. Define (a) Sialogogues; (b) Hydragogues; (c) Sternutatories; (d) Prophylactics; (e) Analgesics.
8. What part or parts of following are used: (a) Calamus; (b) Myrrh; (c) Viburnum Opulus; (d) Euonymus; (e) Eupatorium.
9. Give medicinal use of following: (a) Acidum Gallicum; (b) Acidum Hydrocyanicum; (c) Ammonii Bromidum; (d) Cerii Oxalas; (e) Bismuthi Subgallas.
10. Give Latin names of the following: (a) Black Haw; (b) Cane Sugar; (c) Marigold; (d) Boneset; (e) Queen's Root.
11. (a) What is the pistil of a flower? (b) What is the meaning of an Endogenous Stem? (c) Name three different forms of leaves.
12. Give medicinal properties of (a) Acetanilidum; (b) Atropine Sulph; (c) Camphora; (d) Ethylic Chloridum.
13. From what is Cera Alba obtained?
14. From what is Serum Antidiphthericum obtained?
15. Give Latin name and uses of Henbane.

Toxicology and Posology.

1. State the condition of pupils and skin in Belladonna poisoning.
2. Give antidote for (a) Sulphuric Acid; (b) Aconite; (c) Ether (when swallowed); (d) Lime; (e) Nux Vomica.
3. Give average metric dose of (a) Santonin; (b) Valerianate of Zinc; (c) Creosote; (d) Pow. Ext. Nux Vomica; (e) Tr. Stramonium.
4. Give minimum and maximum doses of (a) Salicylic Acid; (b) Ammon. Carb.; (c) Tr. Belladonna; (d) Caffeine Citrate; (e) Pot. Permanganate.
5. Give antidote for. (a) Nitroglycerine; (b) Acetate of Zinc; (c) Belladonna; (d) Ammoniated Mercury; (e) Antimony.
6. Give average dose of (a) Silver Nitrate; (b) Phosphorus; (c) Tr. Strophanthus; (d) Menthol; (e) Dover's Powder.
7. Would you dispense the following prescriptions? If not, give reasons:

(a) Morphine Sulph.....	gr. 10
Bismuth Sub. Gall.....	3 1
Mix.	
Div. into Pow. No. 15.	
Si. One every six hours.	

(b) Salol	3 3
Strychnine Sulph.	gr. 2
Pow. Ext. Belladonna.....	gr. 20

Mix.

Div. into Pow. No. 40.

S. One after meals.

8. Is the dose of the toxic ingredient in the following prescriptions a safe or an overdose?

(a) Acid Nitrohydrochloric.....	3 5
Ess. Pepsin.....	3 2
Water	ad 3 3

Mix.

S. One teaspoonful before meals.

(b) To Opium Camph.

Syr. Ginger.

Water aa 3 1 |

Mix.

S. One teaspoonful every four hours.

9. Would you dispense the following prescriptions? If not, give reasons.

(a) Santonin	3 2
Calomel	gr. 30
Pow. Sugar.....	3 2

Mix.

Div. into Pow. No. 30.

S. One at night.

(b) Codeine Sulph.....	3 1½
Terpin Hydrate.....	3 3
Pow. Ipecac.....	3 1

Mix.

Div. into Cap. No. 40.

S. One every three hours.

10. Give the chemical antidote for (a) Creosote; (b) Lead Acetate.

Examination for Assistant Pharmacist.

Pharmacy.

- (a) What is Commination and how effected? (b) Define Fractional Distillation.
- State how the following preparations are made: (a) Elixir Aromaticum; (b) Collodion.
- (a) What is a Menstruum? (b) an Excipient? (c) a Precipitate?
- Describe three methods for preparing official Tinctures. (b) Give an example of each.
- Define in detail the manipulation necessary to make the following preparations: (a) Lime Water; (b) Camphor Water; (c) Cerate.
- Give the Latin official title for the following: (a) Epsom Salts; (b) Calomel; (c) Cream Tartar; (d) Rochelle Salts; (e) Brown Mixture.
- Give the best solvent for the following: (a) Iodine; (b) Resins; (c) Tartar Emetic.
- Give the official name and ingredient of each of the following: (a) Chalk Mixture; (b) Compound Powder of Glycyrriza; (c) Ointment.
- Explain the meaning of the terms "Volatile" and "Fixed" oils. Give an example of each.
- (a) What is the best means of effecting the solution of a solid? (b) Is there any difference between Spirits of Ammonia and Aqua Ammonia? If so, what?

Chemistry.

- Name the two (2) series of compounds formed by Fe and Hg with examples of each.
- What color is imparted to a non-luminous flame by (a) Sodium Salts; (b) Potassium Salts; (c) Barium Salts.
- Give chemical name for each of the following: (a) $KClO_3$; (b) $NH_4C_2H_3O_2$; (c) $KMnO_4$; (d) $CHCl_3$; (e) C_2H_5OH .
- Complete the following equation, naming all the members: $HgNO_3 + HCl = ?$
- In what proportion by volume and by weight are H and O combined in Hydrogen Dioxide?
- (a) What is Calomel chemically? (b) What is Corrosive Sublimate chemically? (c) Give a simple test to distinguish one from the other.
- What is the percentage strength of: (a) Water of ammonia? (b) Stronger Water of Ammonia? (c) Glacial Acetic Acid? (d) Acetic Acid?
- (a) Name five inorganic acids, giving formula for each. (b) Name five organic acids, giving source of each.
- Name the following salts in the order of their solubility in water: (a) Zinc Sulphate; (b) Gallic Acid; (c) Sodium Chloride; (d) Lime; (e) Sodium Bicarbonate.
- How much Mercury is contained in ten grains of $HgCl$? (Atomic weights $Hg=200$; $Cl=35$).

Botany and Materia Medica.

- Nux Vomica. (a) What part or parts of plant are used? (b) Give medicinal properties. (c) Give dose. (d) What alkaloid is obtained from it?
- Give Latin names for following and name part or parts used: (a) Sage; (b) Bitter Apple; (c) Soap Bark; (d) Dandelion.
- Griffith's Mixture. (a) Give Latin name. (b) Give medicinal properties.
- Give medicinal properties of: (a) Sodii Salicylas; (b) Sodii Phosphas; (c) Ipecacuanhae; (d) Sanguinaria; (e) Terpini Hydras.
- Give source of following: (a) Cocaine; (b) Atropine; (c) Quinine; (d) Codeine; (e) Physostigmine.
- Give official Latin names of the following: (a) Gray Powder; (b) Quicksilver; (c) Lunar Caustic; (d) Spirit of Mindererus; (e) Glauber Salts.

7. What is the meaning of each of the following: (a) Counter-irritant; (b) Emolient; (c) Cardiac Stimulant; (d) Anthelmintic; (e) Astringent.

8. (a) What is meant by the apex of a leaf? (b) What is meant by the margin of a leaf? (c) What is meant by the petiole of a leaf?

9. Give Latin names for the following: (a) English Salts; (b) Mild Mercury; (c) Cream of Tartar; (d) Hive Syrup; (e) Salts of Tartar.

10. Give medicinal properties of: (a) Alumen Exsiccatum; (b) Ceril Oxalas; (c) Argenti Nitras; (d) Oleum Morrhuæ; (e) Digitalis.

Toxicology and Posology.

1. What is the best chemical antidote for Silver Nitrate and what does it do?

2. Give antidote for: (a) Hydrochloric Acid; (b) Paris Green; (c) Caustic Potash; (d) Iodine; (e) Belladonna.

3. Give minimum and maximum doses of: (a) Tr. Aconite; (b) Acid Hydrochloric Dil; (c) Tr. Belladonna; (d) Acetanilid; (e) Ammon. Chloride.

4. Give average dose of: (a) Morphine Sulph.; (b) Fowler's Solution; (c) Tr. Chlor. of Iron; (d) Tr. Opium; (e) Strychnine Sulph.

5. What is the largest dose you would dispense of: (a) Atropine Sulph? (b) Potass. Bromide? (c) Acid Hydrocyanic Dil? (d) Sodium Salicylate? (e) Tr. Ginger?

6. Give antidote for: (a) Strychnine; (b) Laudanum; (c) Ammonia; (d) Lead Acetate; (e) Acid Oxalic.

7. Would you dispense the following? If not, give reasons:

(a) Potass. Citrate.
Potass. Acetate..... aa 3 4
Tr. Belladonna..... 3 5
Simple Elix. add..... 3 4

Mix.

S. Teaspoonful three times a day.

(b) Calomel.

Soda Bicarb..... aa 3 1

Div. into Pow. No. 6.

No. 5, (Value 30).

Prepare 100 Cc. Syrup of Tolu as follows:

Tincture of Tolu..... 5 Cc.
Magnesium Carbonate..... 1 Gm.
Sugar 82 Gm.
Water..... a sufficient quantity to make 100 Cc.

Rub the Tincture of Tolu with the Magnesium Carbonate and 6 Gms. of the Sugar. Then gradually add 45 Cc. of water and filter. Dissolve the remainder of the Sugar in the filtrate with the aid of a gentle heat, strain and add water enough to make 100 Cc.

No. 6, (Value 5).

Neatness in labelling and wrapping will be considered and marked accordingly.

Chewing Gum.

In a recent issue of the *Chemist and Druggist* was given the following process for making the various sorts of chewing gum:

Chicle gum, employed as a basis of chewing-gum, is first purified from foreign matter by boiling with water and drying the gum. The general formula is as follows:

Gum chicle..... 1 pound.
Powdered sugar..... 3 pounds.
Flavoring ingredients..... enough.

The gum chicle is coarsely powdered, mixed with the sugar, and then heated in an evaporating-basin until the mass softens. It is then well worked and transferred to a slab sprinkled with sugar, the flavoring ingredients are added, and the whole kneaded until uniform. Finally, the mass is rolled out into thin sheets, and while still warm cut into flat sticks, a little powdered sugar being used to prevent the mass sticking to the slab.

The flavorings are essential oils, used in the proportion of 1 to 2 drams to the pound of finished gum. The flavors employed are peppermint, wintergreen, cassia, sassafras, almond, cloves, vanilla, and orris [and the latterly popular spearmint].

Pepsin gum is made by adding ½ ounce of pepsin to each pound of basis; *kola gum* by the addition of 1 ounce of powdered roasted kola-nut; and *black gum* by using the same quantity of extract of licorice. *Chocolate gum* contains powdered chocolate, and may be flavored with vanilla.

Endeavors are often made to cheapen the production by introducing other ingredients, among which is paraffin wax—a not altogether desirable substance, owing to its complete indigestibility. The same objection does not apply to spruce gum, which in the variety known as *spruce chewing gum* is employed in an equal proportion to the chicle gum.

Synthetic Wallflower Odor.

Oil of rose geranium..... 8 minims.
Oil of linaloe..... 8 minims.
Oil of ylang-ylang..... 8 minims.
Oil of cloves..... 8 minims.
Oil of bitter almond..... 8 minims.
Oil of neroli..... 8 minims.
Cumarin 8 grains.
Tincture of musk..... 10 drams.
Tincture of orris..... 10 drams.
Jasmin extract..... 5½ ounces.
Tuberose extract..... 4 ounces.
Tincture of vanilla..... 1½ ounces.
Alcohol (80%)...enough to make 2 pints.

Forgetting to charge goods bought on credit has doubtless been the ruin of many merchants.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Why Some College Graduates Fail at State Board Examinations.

Philadelphia, Pa., September 22d, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I do not know whether it is exactly proper for so humble a person as myself to raise a voice in the controversy regarding graduation and licensure. Nevertheless I have done so with the object of presenting the view of those whom the controversy primarily concerns, namely the prospective pharmacists.

The poor showing of graduates of the "recognized colleges" before the State boards is the combined fault of the average proprietor, the average college graduate, and the State boards.

I will endeavor to prove this by stating some straight, hard, cold facts which every pharmacist, teacher and graduate knows to be true.

First. Why is the average proprietor at fault?

At the "recognized colleges" we are taught theory and practice such as becomes the highest type of pharmacist. They teach us and impress upon our minds that in order to live up to our chosen profession we must furnish what is asked for on a physician's prescription. Furthermore, they tell us that we must prepare the prescribed articles according to the recognized standards. Also, that these preparations must be made with infinite care by us if the prescription is to produce the desired effect.

We go back to the store, and, for example, start to make up a lot of "citrate of magnesia" strictly U. S. P., as our label claims. The "boss" looks on a minute and says, "We don't make our citrate according to the U. S. P. here. We always add some epsom salt and use less citric acid and magnesium carbonate"; or he will prepare it himself according to his private formula.

Next the syrup of iodide of iron runs out, and we start to weigh out our card teeth and iodine, just as we did it at college. Again the "boss" interrupts and says "Say, young fellow, this is an up-to-date store. You'll find some X. Z. Co.'s concentrated solution in the cellar-way, make it from that."

Then we run out of some tincture directed to be made by percolation and start to prepare that, but his watchful eye detects the "slip" in time and he hands you the fluidextract of the drug made by some firm of questionable character and tells you to make it according to the formula on the back of the bottle.

Maybe you will get a prescription for some U. S. P. pill. Instead of making it, you are compelled to use some manufacturer's ready-made pill.

And the reason they give you for doing this sort of thing is to save time. Save time for what? Oh! to attend to the soda fountain, cigars, windows, telephone messages and the thousand and one other side lines.

Hundreds of instances like the above could be cited.

Is it any wonder then that a graduate taught professional pharmacy at college, compelled to do things according to the methods and formulas of his employer, or still worse employers (no two of whom seem to do things alike) is at his wits' end when examined by a third party, the State board?

When asked how to prepare this, that, or the other, his way of doing it in stores comes to him first because he has done it that way so often. When he remembers what the professors told him he becomes confused, and his answers are not representative of what has been taught him, and what he knows to be right.

Yes, sad to relate, the average proprietor will laugh at you when, alive with enthusiasm over your profession, instilled into you by your professors, you attempt to practice it. They say "Forget it, boy; that stuff is all right to preach, but practicing it will never get you or me a dollar."

So they educate us in our four years, which are required for registration and average 16,640 hours, to be "commercial druggists." Then we go to college for 1,500 hours, or less, of real professional pharmacy and the State board asks us questions that a "professional pharmacist" should be able to answer about things that we did and were taught correctly for 1,500 hours, and practiced incorrectly for 16,640 hours.

Of course, not all pharmacists are of the type described, but neither do all graduates fail to pass. Where one is fortunate enough to have a Blair, a Hunsberger, a Beringer, a Raubenheimer or one of the other good ones as a preceptor, there is little chance of not becoming professional. These men, however, are, by far, in the minority.

Second. Why is the average graduate at fault?

I am sorry to say that a great percentage of pharmacy students are not square.

So much depends on the student's getting through college and passing the State board, that he will leave no stone unturned to gain his ends. He will appeal to the sympathy of the professors and board examiners. Failing to get any material aid there, he will appeal to class-mates and his societies to help him out. Finally, he will make out a crib and by hook or crook pass his examinations.

The reason he can pass college examinations in this manner easier than the State board, is because he knows what subject he will be examined on, and just what has been gone over at college in that year.

The State board questions cover so vast a field that he does not know what to put on his crib, so he trusts to luck, his neighbor, and his eyesight. If these assets fail him, he meets his Waterloo and the college is blamed for graduating him.

There are few drug clerks who really want to be true pharmacists. Most of them welcome the easy way out of making U. S. P. preparations proposed by the "boss" and think he is great, but when they happen to get a job with a real pharmacist, he is a crank and they quit. Thus through lack of character and ambition they fall into that seemingly endless rut, and if they do pass college and board, become the same type of commercial druggist as their preceptor—only a little bit worse.

Another factor that creeps in is the dishonesty, or rather perjury, regarding practical experience. Clerk upon clerk goes to a notary and swears that he has

had four years of practical experience, and employer upon employer will do likewise for him, when the truth is that he has had three years, two years, one year, or perhaps no experience at all. Of course, this shows up in the answers he gives to practical work and in the way he makes his preparations. But who is there to contradict his sworn statement. Again the college is unjustly blamed.

Third. Why are the State boards at fault?

In the first place they are too full of politics. The examiners are appointed by politicians, many use politics to get on the board and practice politics while they are members.

Many fellows have passed a board because their congressman "tipped off" the examiner.

Many fellows have flunked because examiners have had personal feelings against them, their preceptors or their college.

We have also heard the report that the registration must be kept low so as to keep up the high standard of the State. Thus, if there is an overflow of pharmacists in the State, more applicants have to flunk. They never publish your average.

Furthermore, State boards in order to dig up new questions go way back behind our times. They ask us of drugs, preparations, and methods long forgotten, and never known to the present applicant.

Their tendency is more to the catch question than to the straightforward one which will not confuse. There seems to be a desire to establish how little a fellow knows instead of how much he knows.

State boards seem to take a delight in "showing up" the "recognized colleges" at the expense of their graduates. Their examinations are unfair in another sense. We hear of movements for the promotion of the public health every day. They advocate more light, better ventilation and sanitary conditions in general.

Let us pass into the examining rooms of the State board. We see a stuffy, poorly ventilated, poorly illuminated room in which one hundred and fifty or more applicants are confined for six hours or more. Under these conditions they are to answer one hundred and fifty to two hundred questions, many of which require tedious calculations and all of which require a certain amount of reasoning. It stands to reason that candidates subjected to this ordeal under such adverse conditions are unable to do their best.

Another point is, that every one knows that each question has a different value, but these values are not published. The examiner can thus give one man one value for a correct answer and the next man a greater or less value, just depending on whether he wants to pass him or "flunk" him. In this way they can bring up or pull down a general average to suit themselves, but the applicant has no redress.

The thing taken as a whole dwindles down to the profession itself. If pharmacy attains its true place in the professions which it formerly held, apprentice and employer will work together along professional lines; college faculties and State boards will work together along professional lines, and the portals of the profession will be closed to those whose aspirations are not professional.

At present, the colleges and their faculties are working hard toward that end. The proprietors and State boards are shooting wide of the mark. When we see the poor answers given by the graduate of the college, whose president is also president of the State

board, we cannot help but think that State board and college must be working in opposite directions.

ROBERT P. FISCHER, PH. G.

Proposed National Formulary Formulas.

Washington, D. C., October 21st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I am sending you herewith, for general discussion, an installment of formulas that it is proposed to add to the National Formulary, and trust that you will be willing to bring them to the attention of members of the American Pharmaceutical Association and other pharmacists and druggists who may be interested.

The object of giving publicity to proposed changes and additions is to elicit, if possible, comment and criticism before the final publication of the fourth edition of the National Formulary so as to avoid, as much as possible, untoward criticism of the book after its promulgation as a national standard.

If editors of pharmaceutical journals will give publicity to the material as offered, and if secretaries of local branches of the American Pharmaceutical Association will offer this material for experimentation and discussion there will be no danger of incorporating into the forthcoming edition of the National Formulary formulas that have not been thoroughly tried in the different sections of the country under varying conditions.

In this connection it should be remembered that failure to criticise any or all of these formulas must be taken as a tacit acquiescence and will necessarily lead members of the committee on National Formulary to infer that the formulas as offered are acceptable.

Trusting that you will be willing to co-operate in the work of perfecting the National Formulary, I am, [etc.].

M. I. WILBERT.

[The enclosure follows, edited to make it uniform in appearance with other matter of a like nature printed in THE DRUGGISTS CIRCULAR. We trust that our readers will comment on and criticise the formulas, as requested.—Editor THE DRUGGISTS CIRCULAR.]

National Formulary.

The following are some of the new formulas that have been suggested for inclusion in the forthcoming edition of the National Formulary. The committee is desirous of having them thoroughly tried by pharmacists in different sections of the country so as to avoid, as much as possible, unfavorable comment after the final publication of the book. Comments and criticisms based on practical experience will be welcome. All communications should be addressed to the Chairman of the Committee, Prof. C. Lewis Diehl, 932 Cherokee road, Louisville, Ky., who will submit the comment to the sub-committee having the matter in charge:

Elixir Amygdalæ Compositum.

Compound Elixir of Almond.

Oil of bitter almond.....	6.5 c.c. (mil).
Vanillin	1.0 gramme.
Stronger orange flower water.....	150.0 c.c. (mils).
Alcohol	50.0 c.c. (mils).
Syrup	400.0 c.c. (mils).
Kieselguhr	10.0 grammes.
Distilled water....enough to make	1000.0 c.c. (mils).

Dissolve the oil of bitter almond and the vanillin in the alcohol, add the syrup and then the stronger orange flower water, then the distilled water in several portions, shaking the mixture thoroughly after each addition; then add the kieselguhr, mix and filter, returning the first portion of the filtrate, if necessary, until it runs through

clear. Lastly, wash the filter with sufficient of a mixture of alcohol 1 volume and distilled water 19 volumes, until 1000 c.c. (mils) of product is obtained.

Elixir Glycyrrhizæ Aquosum.

Aqueous Elixir of Licorice. Aqueous Elixir of Glycyrrhiza.
Fluidextract of glycyrrhiza..... 150 c.c. (mils).
Compound spirit of cardamom..... 5 c.c. (mils).
Stronger orange flower water..... 200 c.c. (mils).
Glycerin 150 c.c. (mils).
Syrup 150 c.c. (mils).
Water.....enough to make 1000 c.c. (mils).
Mix and filter.

Elixir Rubrum.

Red Elixir.

Cudbear 2 grammes.
Aromatic elixir..... 1000 c.c. (mils).

Add the cudbear to the aromatic elixir, in a suitable container, and allow the mixture to stand for six hours with occasional agitation, then filter.

Elixir Cardamomi Compositum.

Compound Elixir of Cardamom.

Compound spirit of cardamom..... 10 c.c. (mils).
Alcohol 90 c.c. (mils).
Syrup 400 c.c. (mils).
Kieselguhr 10 grammes.
Distilled water.....enough to make 1000 c.c. (mils).

Mix the compound spirit of cardamom with the alcohol, add the syrup and then the distilled water in several portions, shaking the mixture thoroughly after each addition; then add the kieselguhr, mix and filter, returning the first portion of the filtrate, if necessary, till it runs through clear. Lastly, wash the filter with sufficient of a mixture of alcohol 1 volume and distilled water 9 volumes, until 1000 c.c. (mils) of product is obtained.

Spiritus Cardamomi Compositus.

Compound Spirit of Cardamom.

Oil of cardamom..... 20.0 c.c. (mils).
Oil of orange..... 20.0 c.c. (mils).
Oil of cassia..... 2.0 c.c. (mils).
Oil of cloves..... 1.0 c.c. (mils).
Alcohol [sic]..... 1.0 c.c. (mil).
Oil of caraway..... 0.1 c.c. (mil).
Alcohol.....enough to make 200.0 c.c. (mils).

Mix the oils with 140 c.c. (mils) of alcohol, finally adding a sufficient quantity of alcohol to make the spirit measure 200 c.c. (mils).

Elixir Vanillini Compositum.

Compound Elixir of Vanillin.

Compound spirit of vanillin..... 20 c.c. (mils).
Alcohol 80 c.c. (mils).
Glycerin 25 c.c. (mils).
Syrup 300 c.c. (mils).
Kieselguhr 10 grammes.
Tincture of caramel..... 20 c.c. (mils).
Distilled water.....enough to make 1000 c.c. (mils).

Mix the compound spirit of vanillin with the alcohol, add the glycerin, and then the syrup and the distilled water in several portions, shaking the mixture thoroughly after each addition; then add the kieselguhr, mix and filter, returning the first portion of the filtrate, if necessary, till it runs through clear. Lastly, wash the filter with a mixture of alcohol 1 volume and distilled water 9 volumes, until 980 c.c. (mils) of product is obtained. Finally, add 20 c.c. (mils) of tincture of caramel.

Elixir Trium Bromidorum.

Elixir of Three Bromides.

Potassium bromide..... 80 grammes.
Ammonium bromide..... 80 grammes.
Sodium bromide..... 80 grammes.
Cudbear 2 grammes.
Compound elixir of almond to make. 1000 c.c. (mils).

Dissolve the bromides in sufficient compound elixir of almond, add the cudbear and allow the mixture to macerate in a closely stoppered bottle for six hours, with occasional shaking. Finally filter.

Elixir Formatum.

Elixir of Formates.

Potassium formate..... 50 grammes.
Sodium formate..... 50 grammes.
Aromatic elixir.....enough to make 1000 c.c. (mils).
Dissolve the formates in the aromatic elixir and filter.

Elixir Formatum Compositum.

Compound Elixir of Formates.

Monohydrated sodium carbonate.... 23 grammes.
Magnesium carbonate..... 20 grammes.
Strontium carbonate..... 25 grammes.
Lithium carbonate..... 8 grammes.
Quinine alkaloid..... 7.7 grammes.
Formic acid..... 200 c.c. (mils).
Compound spirit of cardamom..... 10 c.c. (mils).
Acetic ether..... 2 c.c. (mils).
Alcohol 100 c.c. (mils).
Glycerin 300 c.c. (mils).
Purified talc..... 20 grammes.
Distilled water.....enough to make 1000 c.c. (mils).

Add the formic acid to 300 c.c. (mils) of distilled water and in this dissolve the carbonates and then add the quinine; to this solution add the glycerin and then the alcohol previously mixed with the compound spirit of cardamom and the acetic ether, agitate thoroughly and add sufficient distilled water to make the product measure 1000 c.c. (mils). Then add the purified talc, mix and filter with sufficient mixture of alcohol, 1 volume, distilled water 9 volumes, until 1000 c.c. (mils) of finished preparation is obtained.

Spiritus Vanillini Compositus.

Compound Spirit of Vanillin.

Vanillin 40 grammes.
Oil of orange..... 10 c.c. (mils).
Oil of cardamom..... 2 c.c. (mils).
Oil of cassia..... 1 c.c. (mil).
Alcohol enough to make 200 c.c. (mils).

Dissolve the vanillin and the essential oils in 150 c.c. (mils) of alcohol and then add sufficient alcohol to obtain 200 c.c. (mils) of product. Store in tightly stoppered amber colored vials, in a cool place, protected from light.

Elixir Aurantii Amari.

Elixir of Curacao.

Elixir of Bitter Orange.

Oil of bitter orange..... 4 c.c. (mils).
Tincture of bitter orange peel..... 20 c.c. (mils).
Alcohol 300 c.c. (mils).
Stronger orange flower water..... 20 c.c. (mils).
Syrup 400 c.c. (mils).
Kieselguhr 10 grammes.
Distilled water.....enough to make 1000 c.c. (mils).

Mix the oil of bitter orange and the tincture of bitter orange peel with the alcohol, add the syrup and then the stronger orange flower water and then the distilled water, in several portions, shaking the mixture thoroughly after each addition; then add the kieselguhr, mix and filter, returning the first portion of the filtrate, if necessary, till it comes through clear. Lastly, wash the filter with sufficient of a mixture of alcohol 3 volumes and distilled water 7 volumes, until 1000 c.c. (mils) of product is obtained.

Elixir Sodii Salicylatis Compositum.

Compound Elixir of Sodium Salicylate.

Sodium salicylate..... 80 grammes.
Fluidextract of cimicifuga..... 32 c.c. (mils).
Fluidextract of gelsemium..... 16 c.c. (mils).
Potassium iodide..... 16 grammes.
Purified talc..... 15 grammes.
Aromatic elixir.....enough to make 1000 c.c. (mils).

Dissolve the sodium salicylate and potassium iodide in 800 c.c. (mils) of aromatic elixir to make 1000 c.c. (mils). Add the purified talc, mix and filter.

Compound elixir of sodium salicylate should be kept in amber-colored bottles, protected from the light.

Work for the N. A. R. D. to Do.

Pittsburgh, Pa., October 14th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The tone of your editorial on the 1911 meeting of the National Association of Retail Druggists pleases me, for it seems to urge us to more substantial progress. It seems to say: "You have done well, but with a little more determination you could have done better." And this reminds me of Andy Carnegie's sentiments, viz.: "Divine discontent" has accomplished the great things in history. The incentive toward betterment is the force that carries civilization

forward. Nothing is ever achieved by folding one's hands and "letting well enough alone."

And let me say that the resolution which referred to "blind tigers" was intended to show the need of laws which will give pharmacy boards *judicial powers*. All States should prohibit the opening of new drug stores without a permit or license, and they should provide for an annual renewal of license by all existing drug stores. The license should cover the individual, the town, and the street location. The boards should have power to refuse a new license, or renewal of one, for cause. In this way only can a proper control of the practice of pharmacy be maintained, in prohibition districts especially.

LOUIS EMANUEL.

Colleges and Boards Both to Blame.

Terrell, Tex., October 19th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have read with much interest the articles appearing in the October and other issues of the CIRCULAR on the subject of the failures of college graduates to pass the board of pharmacy examinations, and the different suggestions for remedies for said failures. Supposing the subject still open for discussion, I wish to express my views on it.

First. The points brought out in the article, "Gettery and Forgettery of College Students," page 578, October CIRCULAR, clearly show to my mind that the colleges are at fault in admitting students whose literary training has been too limited to enable them to think, and reason carefully on scientific subjects, and thus the student is taught to rely on committing to memory quizzes and lectures instead of reasoning from scientific principles, gained from careful classroom study.

Second. Classes in these schools are usually so large that direct recitation is impossible, and the student has little or no chance to let the instructor know just where his weak points are, and these weak points, being overcome by the quiz system of preparing for examinations, are clearly brought out in the board examinations.

Third. I think that too much time and attention is given to high-class technicalities, which are of little or no concern to the retail drug clerk, and too little to those things which the druggist has need of daily. I think the boards of pharmacy could greatly assist the profession of pharmacy by eliminating such things from the examinations as only a specialist would be required to know, and in place of this give practical tests in such things as would be needed daily by the prescription druggist.

The committing to memory of the chemical symbols of the alkaloids is not as important to the druggist as a knowledge of the use, dose and incompatibles of these alkaloids. A closer unity between the college officials and the boards of pharmacy would do much to reduce the number of failures of graduates to pass the boards.

JAMES FOSTER.

There is something in the cork as well as in the bottle. Poor corks give a customer that kind of idea of the druggist who sends them out.

Who has seen a case recently of one label stuck over another on a bottle? For instance, a paregoric label stuck over a laudanum one?

Notices of Books Received.

A LABORATORY GUIDE IN BACTERIOLOGY for the Use of Students, Teachers and Practitioners. By Paul G. Heinemann, Ph. D. Second Edition. Duodecimo; cloth; xv + 210 pages; illustrated. \$1.50 net. Chicago: University of Chicago Press.

Here is a little book that seems to merit well its name of "Guide," for it points the way to the details and the principles of laboratory work in bacteriology intelligibly to the beginner as well as to the finished bacteriologist. The illustrations aid considerably toward a comprehension of the text.

Bacteriology is fast becoming recognized in its multi-phased influence. Even in medicine where it long has played a prominent part, the advances in the recognition of its many roles have been most marked. On the pharmacal side of medicine particularly bacteriology has recently advanced with rapid strides, and everywhere druggists now have use for a book like this guide. The more use they make of such a book and profit by that use in practice the more they are entitled to recognition as aids to the physician. In this guide they may find, simply and plainly set forth, facts of bacteriological technic, and general bacteriological practice, methods for the bacteriological examination of water, milk and soil, directions for preparing culture media and stains, dilution tables, and a comprehensive chapter on important pathogenic bacteria.

PRACTICAL MEDICAL CHEMISTRY for Physicians and Students. By Charles Platt, A. C., M. D., Ph. D., F. C. C. Lond., and William A. Pearson, Ph. C., Ph. D. Sixth Edition, Rewritten and Enlarged. Octavo; cloth; 260 pages, interleaved. \$2.50 net. Philadelphia: John Jos. McVey. 1910.

There is a clarity about the explanations and directions included in this book that should appeal to the average student of medical chemistry. Doubtless this has been one of the reasons for the sale of five editions. The general plan of arrangement is also to be commended. Students and practitioners will appreciate the interleaved blank pages for notes.

Several new chapters are a part of the present edition; and the authors state that the entire text has been critically revised. The subdivisions are (1) inorganic chemistry, (2) chemistry of the carbon compounds, and (3) physiological and clinical chemistry. In the appendix are a list of poisons and a guide to the treatment of poisoning, tables of weights and measures, solubilities, reagents, and acid radicals.

THE ELEMENTS OF QUALITATIVE ANALYSIS. By Wm. A. Noyes, Ph. D. Sixth Edition, Revised, in Collaboration with the Author, by G. McP. Smith, Ph. D. Octavo; cloth; v + 133 pages. New York: Henry Holt & Co. 1911.

The earlier editions of this work are rather well known to students of analytical chemistry as illustrating a method of presenting that subject so as to obviate later-to-be-regretted skimming through mazy passages. It has been the stated purpose of the author—and a purpose quite well adhered to—to impress his readers with the essentiality of learning a thing correctly in the first place.

In the present edition, there are many changes, chiefly in relation to the hydrogen sulphide group, the ammonium sulphide group, and arsenic, antimony

and tin. The general plan of the book is unaltered. On the fly-leaves are several useful solubility tables and a guide to group compounds.

A POCKET MEDICAL DICTIONARY, Giving the Pronunciation and Definition of the Principal Words Used in Medicine and the Collateral Sciences, Including Very Complete Tables of the Arteries, Muscles, Nerves, Bacteria, Bacilli, Micrococci, Spirilla, and Thermometric Scales, and a New Dose List of Drugs and Their Preparations, in Both the English and Metric Systems of Weights and Measures, Based upon the Eighth Revision U. S. Pharmacopoeia also a Veterinary Dose Table. By George M. Gould A. M., M. D. Sixth Edition, Revised and Enlarged, 34,000 Words. Sixteenmo; limp leather; 1,005 pages. \$1 net. Philadelphia: P. Blakiston's Son & Co. 1911.

A glance at the sub-title of this handy lexicon, which well enumerates its contents, will serve to show the usefulness of the book to druggist and drug clerk, and suggest its fitness as a gift to doctor or nurse.

THE MONARDAS; a Phytochemical Study. By Nellie Wakeman. A Contribution from the Course in Pharmacy at the University of Wisconsin.

This bulletin is a valuable addition to the literature of indigenous medicinal plants. Its contents embrace a chapter on the history of the genus monarda; a review of the chemical work on the genus; and chapters on the oils, pigmentation, and ferments of the several species. The author is an assistant in pharmaceutical chemistry at the University of Wisconsin.

ON THE ADDITION OF ORGANIC ACIDS TO UNSATURATED HYDROCARBONS. By Arthur F. Stevens. A Thesis Presented for the Degree of Bachelor of Science, the University of Wisconsin, 1909. Contributions from the Course in Pharmacy.

There is a healthy difference between this thesis and the paraphrased dispensatory monographs so frequent among graduates in pharmacy theses, that is encouraging to those who hope for better things in pharmacy.

THE PHYSIOLOGICAL STANDARDIZATION OF ERGOT. By Charles Wallis Edmunds and Worth Hale. Bulletin No. 76, Hygienic Laboratory, Public Health and Marine-Hospital Service of the United States.

THE MILK SUPPLY OF CHICAGO AND WASHINGTON. By George M. Whitaker, M. A., Sc. D. Bulletin 138, Bureau of Animal Industry, United States Department of Agriculture.

THE ACTION OF DRUGS UNDER PATHOLOGICAL CONDITIONS. By William Salant. Circular No. 81, Bureau of Chemistry, United States Department of Agriculture.

PROCEEDINGS OF THE MISSISSIPPI PHARMACEUTICAL ASSOCIATION at the Ninth Annual Meeting, Held at Greenville, June 13th and 14th, 1911.

SECOND ANNUAL REPORT OF THE MISSOURI BOARD OF PHARMACY for the Fiscal Year Ending July 31st, 1911.

A Change in the Federal Board of Food and Drug Inspection.

Early last month Secretary Wilson announced that Solicitor McCabe had asked to be relieved from serving upon the Board of Food and Drug Inspection, and that this request had been granted; that Dr. F. L. Dunlap, associate chemist, had been in Washington the entire summer, and was then about to go upon his vacation; and during his absence R. E. Doolittle, chief of the bureau of chemistry laboratory in this city, would sit with Dr. Wiley on the board.

In a subsequent order Dr. Doolittle was designated as successor to Mr. McCabe and the following directions given as to procedure of the board:

Recommendations for seizures under section 10 of the food and drugs act will be made by the board of food and drugs inspection, and when approved by the secretary the papers in connection therewith will be transmitted to the department of justice, through the office of the solicitor.

The employment of expert witnesses in cases arising under the food and drugs act will be considered by the board of food and drugs inspection, and recommendation made to the secretary. The amount of fees to be paid such witnesses will also be considered and determined by the board of food and drugs inspection, subject to the approval of the secretary.

Hereafter, and until otherwise ordered, all questions relating to citations for hearings under section 4 of the food and drugs act will be considered by the board of food and drugs inspection, and the determination made by a majority of that board as to whether or not citation shall issue. After hearings are held, determination as to whether or not the case shall be sent to the department of justice for prosecution shall be made by a majority of the board of food and drugs inspection. All cases recommended for prosecution by the board of food and drugs inspection will be transmitted to the office of the solicitor for preparation and transmittal to the department of justice. General order No. 140, dated June 9th, 1910, is hereby amended accordingly.

In connection with the announcement he has made, Secretary Wilson takes pains to declare in emphatic terms that it is the purpose of the department to give every possible facility to the enforcement of the pure food law.

Federal Positions Open.

The United States civil service commission announces an examination, of men only, to secure eligibles from which to make certification to fill several vacancies in the position of *pharmaceutical chemist*, at salaries ranging from \$1,600 to \$1,800 per annum, in the bureau of chemistry, department of agriculture, and vacancies requiring similar qualifications as they may occur, unless it shall be decided in the interest of the service to fill the vacancies by reinstatement, transfer, or promotion. The duties of the position will consist in making analyses of drugs and medicines and studying methods of analyses in the drug division of the bureau of chemistry at Washington, D. C., or in some of the branch laboratories of the bureau. Applicants are required to have an educational training equivalent to that required for the degree of bachelor of science from a reputable college or university. Such training should include a course in chemistry equivalent to three years of work with at least nine recitation hours a week, three laboratory hours being counted as one recitation hour. However, since it is desirable that applicants have had training in botany, pharmacognosy, and pharmacy, time given to any of these branches may be substituted, in part, for the chemical requirements. In addition, at least one year of post-graduate training or practical experience along lines related to the analysis of drugs, medicines, or organic technical preparations is a prerequisite for consideration for this position. Applicants must be not less than twenty-two years old nor more than forty-five at the time of examination. Applications must be filed with the commissioners at Washington before the closing of business on November 22d.

An examination to secure a list of eligibles for the position of *assistant pharmaceutical chemist* is also announced, to be held November 22d. The salary ranges from \$1,200 to \$1,400 per annum.

Further particulars of either examination may be obtained from the United States civil service commission, Washington, D. C.

The American Druggist's Fire Insurance Co. of Cincinnati has withdrawn from Texas and lodged a strong protest against the operation of the rate-regulating law. It is contended that the law stifles competition and will result in the withdrawal of all companies which are disposed to sell insurance at lower than the board rate.

German Officials on Sodium Benzoate.

The report made by the health officials of Germany on the use of sodium benzoate in foods, and which sustains the position originally taken by Dr. Wiley, and is antagonistic to the position taken by the Remsen board, has been transmitted to the agricultural department by the officials of the State department. That the German authorities had taken this stand was known, but the details of the report have not been known up to this time. The findings, promulgated by the German government in a public document, are entitled:

Report of the Royal Scientific Deputation for Medical Affairs concerning the uses of benzoic acid and its salts for preserving food materials.

The report contains a full history of the American controversy over sodium benzoate, including a resumé of the opinion of Dr. Wiley, the creation of the Remsen board by order of President Roosevelt, and the opinion of that board reversing the chief chemist. In conclusion the board says:

The Royal Scientific Deputation for Medical Affairs is likewise of the opinion that the use of benzoic acid and benzoates should not be permitted for the preservation of foodstuffs.

For even if in small amounts it may be considered as harmless for the human organism, still there is the danger present that by the addition of these substances to the various foodstuffs and drinks such amounts will be introduced that may possibly result in harm to the organism. This danger exists specially with children, aged persons and weakly and sickly persons, inasmuch as benzoic acid may be formed within the body out of foodstuffs to which no benzoate has been added.

A further consideration, which should be directed against the use of chemical preservatives in general, is that by their use the proper care and cleanliness on the part of the manufacturers and salesmen with such foods as may easily undergo decomposition, putrefaction or mold formation may be neglected; indeed, it may result in lowering the quality of the goods.

This, according to various communications, seems especially to be the case with margarin, for the preserving of which, as intimated, benzoic acid is used at present in large quantities. The commercial margarin at present contains much water, whereby its keeping qualities are lessened, while good margarin, according to a communication from the imperial health department, may be kept for months at a time without preservatives under suitable care. The poorly prepared and high water-containing margarin becomes a better nutrient ground for molds and bacteria, and for these reasons a preservative is required.

Similar considerations should be given in reference to easily decomposing protein-containing foodstuffs. The experiments of the imperial health department have shown, among other things, that a slight putrefactive odor of sausage meat, which may be weakened by simply turning or aerating but not removed, will disappear after a time when 25 per cent. benzoic acid or sodium benzoate is mixed with it. There can be given by this procedure the appearance of freshness to foodstuffs that already have entered upon decomposition, and the buyer may be deceived as to quality.

"Stickers" and the Postal Regulations.

Druggists who sometimes affix a sticker label to an envelope going into the mails will do well to read the following recently promulgated order of the postmaster-general:

No adhesive stamps or imitations of stamps of any form or design whatever other than lawful postage stamps shall be affixed to the address side of domestic mail matter, but such adhesive stamps, provided they do not in form and design resemble lawful postage stamps and do not bear numerals may be affixed to the reverse side of domestic mail matter. All domestic mail matter bearing on the address side adhesive stamps or imitations of stamps other than lawful postage stamps, will be returned to the sender if known; otherwise they will be forwarded to the division of dead letters.

Work Against Narcotics.

The Ohio Valley Druggists' Association at a meeting held in September decided that under no circumstances would it endanger the lives of the public by permitting its members to hand out samples of "patent soothing syrups," which contain narcotic drugs. At the last session of the legislature a bill was passed making it a misdemeanor to distribute from house to house samples of these syrups. To get around the decision the manufacturers have attempted to have the druggists hand the samples out to their customers. The druggists have, however, refused to do it because, they say, such preparations are invariably harmful. They resolved to lend no aid in the distribution of such preparations, but to endeavor to warn the public against the use of soothing syrups which contain narcotic drugs. They decided, further, that they will make every lawful effort to prevent the sale and distribution of such preparations.

Arrests were made in this city last month of two men

charged with illegal sale of cocaine. Both of them had some of the drug in their possession when arrested. Customs officers raided a place which they say was a plant for turning crude opium into the article used by smokers and a wholesale depot for dispensing the drug throughout the eastern part of the country and as far west as Denver. They said it was the first opium factory ever raided in this city. At the same time another force visited a drug store which was under suspicion, where they found a number of cans or shells which contain opium as sold to smokers.

It is stated in a press dispatch from St. Paul that according to a statement made by internal revenue officers, the manufacture of smoking opium has been going on in that city and other large cities of the country since the winter of 1909, without restraint except in a few isolated cases and without federal regulation. "It was thought at first," says the dispatch, "that most of the opium smoked in this country was smuggled in, but this has always been denied by the customs officials. They have admitted that a certain amount of the drug was smuggled, but declared the bulk of it was manufactured in this country."

Reflected Sunlight Causes a Fire.

Official inquiries were completed on Monday into an outbreak of fire the previous forenoon in the window of a chemist's shop in Grangevans, N. B., occupied by Mr. Alexander Tweedie. It appears that the assistant had neglected, on leaving that morning, to draw the blind. The forenoon sun beat fiercely on the window, which was filled with dummie packages and samples of goods, backed up by two large exhibition bottles filled with carbon. These bottles acted as reflectors upon the cardboard packages, which became ignited. The discovery was early made by the tenants above, who raised the alarm. No water was available at the borough mains, as there has lately been a scarcity. Neighbors gave up what little they had stored overnight for domestic purposes, and this fortunately served to extinguish the fire. The stock in the window was destroyed.—*British and Colonial Druggist.*

Sunday Closing.

A number of the pharmacists of Sacramento, Cal., have made an agreement to close their stores every Sunday afternoon from 1 o'clock until 6. The parties to the agreement are: J. B. Stocker & Co., H. L. Yardley Co., Willis & Martin, Benj. Catlett, Anchor Drug Co., Geo. E. Knox, Casey & Dalton, Central Drug Store, Royce & Youngman, Camellia City Pharmacy, M. Sydenstricker, F. J. Quirin, A. B. Chandler, J. L. Lewis, Owl Drug Co., Geo. Z. Waite, Fred Kolliker and Thomas Bickle.

Five Episcopal Churches of Anacostia, D. C., have united in a movement to secure the closing of drug stores on Sunday, except for the sale of necessary medicines.

The pharmacists of Westfield, Mass., have agreed to close their stores at 9 P. M., excepting Monday and Saturday, when they will remain open until 9.30 and 10.30.

National Civic Federation.

A section on pure food and drugs has recently been established by the National Civic Federation. Its first meeting was held at the rooms of the New York Board of Trade and Transportation October 3d.

Among those present were Dr. Wiley, and Dr. E. Eliot Harris, of the committee on legislation of the American Medical Association.

Plans for bringing about uniform State legislation were talked of and President Seth Low of the Civic Federation was empowered to appoint a committee of fifteen to carry out the objects of the new department.

United Drug Company Meeting.

A meeting of the stockholders of the United Drug Company was held at Boston, October 3d to 5th. More than 2,500 persons were in attendance.

President Louis K. Liggett reported a prosperous year, and that the company was practically free from debt.

The officers were re-elected, the list being: President, Louis K. Liggett; vice-presidents, Louis Schreiner, James C. Brady and Fred S. Rodgers; treasurer, James C. McCormick; secretary, C. E. Murman; corporation counsel, Jones Fuller.

National Wholesale Druggists' Association.

The thirty-seventh annual convention of the National Wholesale Druggists' Association was held at the Hotel Astor, this city, October 10th to 13th. The sessions were largely attended, and the entertainment features planned under the direction of Thomas P. Cook, chairman of the committee on arrangements and entertainment, were most enjoyable.

The convention was called to order at 10.30 a. m. by Dr. William Jay Schieffelin, president, who introduced the Hon. John Purroy Mitchel, President of the Board of Aldermen, who delivered a hearty address of welcome, to which response was made by ex-President William A. Hover, of Denver, Colo.

Thomas P. Cook, chairman of the delegation from the American Pharmaceutical Association, extended the greetings of that organization, and response was made by ex-President Thomas F. Main, of New York. The greetings of the New York State Pharmaceutical Association were extended by S. V. B. Swann, of New York, to which response was made by ex-President Charles S. Martin, of Nashville, Tenn. The greetings of the Maine Pharmaceutical Association were extended by A. B. Hodsdon, of Portland, and response was made by George W. Lattimer, of Columbus, Ohio. The privileges of the floor were given to the visiting delegates.

First Vice-President George W. Lattimer, of Columbus, Ohio, took the chair, and President Schieffelin read his address.

PRESIDENT'S ADDRESS.

The president briefly referred to the fact that the association was meeting for the fourth time in this city and expressed his appreciation of the compliment paid him in the association coming this year to his home. He noted the effort being made to promote arbitration between governments, the decisions in the Miles Medical Company case, the Standard Oil Company and American Tobacco Company cases; and the Johnson case; and the effort to oust Dr. Wiley. He spoke of the Foster bill and the probability of further efforts in the next congress to secure proper regulation of interstate traffic in narcotics, expressing his belief in the unanimity of the association for the passage of an effective bill. He mentioned as one of the most important measures pending in congress the proposition to establish a National department of health. From the best information he had been able to obtain he concluded that the wholesale drug business throughout the country had been fairly good during the past year.

The address was referred to a committee, as usual, and was subsequently endorsed by the association.

Dr. Francisco Herrera, secretary of the National Association of Pharmacists, of Cuba, was invited to address the convention, and he extended the greetings of that association. President Schieffelin thanked Dr. Herrera and returned the greetings.

MEMBERSHIP.

The report of the committee on membership showed five applications for active membership and twenty-six for associate membership.

REPORT OF THE SECRETARY.

Secretary J. E. Toms presented a report detailing the various activities of his office. The active members of the association up to March, 1911, numbered 260 and the associates 262.

REPORT OF THE TREASURER.

Treasurer Strong reported that the receipts of the association for the year from dues had been \$18,600.93; from other sources, \$1,493.36; which with a balance of \$8,197.17 from the previous year had made the assets \$28,291.46. The expenditures had been \$19,115.62, leaving a balance of \$9,175.84.

CREDITS AND COLLECTIONS.

The committee on credits and collections reported that it had received 146 replies to its general letter sent out with questions that were more or less pertinent to the affairs of the wholesale drug business. It had developed from these replies that general trade conditions in this country were, during the present year, somewhat varied. Twenty-eight per cent. report that general conditions are below normal, 42 per cent. fair to normal and 30 per cent. above normal. In perusing these replies carefully, it is perfectly evident, says the report, that the differences are governed entirely by local conditions. One class of wholesalers report from the cotton belt, another from the grain

and wheat fields, another from the mining districts and another from the fruit belts. The average, however, is slightly below normal. In the matter of industrial disturbances during 1911, only twenty cities report having suffered in any way by strikes, lockouts, etc. The greater portion of those reporting state that the strikes have not been serious, and generally of short duration. Many interesting details were given as to trade practices.

COMMERCIAL TRAVELERS.

The committee on commercial travelers had been broadened in scope at the 1910 meeting of the association to include selling methods. The chairman, Mr. Theo. M. Meyer, had not found it possible to take up the details of gathering information, but submitted some thoughts on the subject coming within the scope of his committee. He was of opinion that selling methods were left entirely too much in the hands of salesmen. They should be developed in and promulgated by and be under the control of the house.

DRUG MARKET.

An extended report on the drug market was presented by Dr. Adolph W. Miller, for the committee on that subject. Causes were specified for abnormal advances in the prices of certain drugs.

ADULTERATIONS.

In the report of the committee on adulteration it was said that the various efforts to prevent adulteration were being crowned with increasing success. It was believed that most of the trouble still encountered was due to the ignorance of some collectors of indigenous drugs. "A very thorough and complete investigation," says the report, "by personal interviews and correspondence with government and State officials, manufacturers and dealers throughout the country was made in an effort to get the true condition of the drug trade at this time regarding adulterated drugs. As a result we are forced to the conclusion and take much satisfaction in reporting that conditions at this time are very satisfactory and full of encouragement and hope." The presentation of this report was followed by an address, on drug cultivation by Dr. Rodney H. True, of the federal bureau of plant industry.

DECEASED MEMBERS.

The committee on memorials of deceased members reported that during the year the association had lost through death thirteen of its active members and six associates.

LEGISLATION.

The legislative situation was summarized in an exhaustive report of the committee on legislation. The committee offered the following resolution for consideration:

Resolved, That this association is opposed to the enactment of any parcels post legislation, either local or general, firmly believing as we do that the effect of such laws would be to divert the business of the country merchant and tradesman in small cities and towns to large retail departments and catalogue houses in the large cities, to the great detriment of community life throughout the entire country.

This resolution was adopted by the association.

The reports of the various committees mentioned above were adopted. Other reports made and approved were on paints, oils and glass, fire insurance, local associations, transportation, trade-marks, suits against members, and proprietary goods.

Prof. Remington made an address on the forthcoming Pharmacopoeia.

OFFICERS.

Officers for the ensuing year were elected as follows: President, Theo. F. Meyer, of St. Louis; first vice-president, James W. Morrison, of Chicago; second vice-president, Miers Busch, of Philadelphia; third vice-president, F. C. Groover, of Jacksonville, Fla.; fourth vice-president, Levi Wilcox, of Waterbury, Conn.; fifth vice-president, M. P. Northington, of Birmingham, Ala.; secretary, Joseph E. Toms, of New York city; treasurer, Samuel E. Strong, of Cleveland, O. Board of control, Charles Gibson, of Albany; W. B. Strong, of Milwaukee; C. E. Bedwell, of Omaha; A. J. Geer, of Charleston, S. C.; George R. Merrell, of St. Louis.

The association will hold its next annual meeting at Milwaukee, Wis., in October next, the day to be fixed by the committee of arrangements.

Another Riker-Jaynes drug store was opened September 23d, at Boston; the fiftieth in the "chain" of that company. It is quite a large one.

Meetings of American Pharmaceutical Association Branches.

Baltimore.—Discussions of the proposed changes in the Pharmacopœia and the National Formulary comprised the business of the meeting of the Baltimore branch of the American Pharmaceutical Association held October 19th.

The discussion was begun by Prof. Charles Caspari, Jr., who, after explaining the method of procedure followed by the pharmacopœial revision committee and the various sub-divisions thereof, said that many of the proposed pharmacopœial additions and deletions did not have his approval. He could not see the reason for dismissing fluid-extract of rose and retaining the unstable fluid-extract of coca, and he feared that the admission of so many new fluid-extracts into the National Formulary foreboded slackness in the making of tinctures. He characterized as unwise the proposed deletion of compound syrup of hypophosphites and similar much-used preparations.

H. A. B. Dunning reviewed the work of revising the National Formulary, and told of the care with which the N. F. committee was approaching the several phases of its work.

M. I. Wilbert, of Washington, D. C., said that for the N. F. committee, he was sending out copies of proposed formulas and processes for experiment and criticism. He urged every member of the branch to co-operate in the work of revision, and suggested that the branch devote its meetings to the consideration of the proposed formulas.

This suggestion was concurred in; and the executive committee was instructed to make the necessary arrangements.

Nashville.—The new president, J. O. Burge, was installed at the meeting of the Nashville branch of the American Pharmaceutical Association held October 19th. After the several committees had been appointed, J. R. McDaniel, for the program committee, announced the proposed schedule for the season's meetings.

Several other committee chairmen outlined the plans they proposed to carry out.

Reports were made on the past year's meetings of the national organizations as follows: American Pharmaceutical Association, by J. O. Burge; American Chemical Society, by L. J. Desha; National Association of Retail Druggists, by W. R. White; and National Wholesale Druggists' Association, by J. R. McDaniel.

New York.—Routine matters were dispensed with at the meeting of the New York branch of the American Pharmaceutical Association held October 9th, in order that the list of proposed admissions to and deletions from the Pharmacopœia might be considered in detail. The lists as printed were read by Secretary Hugh Craig, the admissions being first considered. The comments follow:

Ammonium bifluoride.—This is used but little and then often with bad results.

Aspidospermine.—It would be better to make quebracho bark official.

Calcium chloride (hydrated crystals).—Two forms of this salt are unnecessary and the hydrated can be kept but a very short time.

Diastase.—This, it was believed, is used very little, and a pure article is obtained with difficulty.

Erythrol tetranitrate.—This is dangerous to handle, being explosive, and is not used to any great extent.

Mercury salicylate.—There was a question as to what sort would be recognized; and the suggestion was made that the official form should be a very fine powder.

Milk of magnesia and *milk of bismuth.*—In this connection the use of trade-marked names was commented upon. The recognition of a method for the assay of these preparations was considered advisable.

Oxygen.—It was pointed out that a standard was necessary for medicinal oxygen and that an official method for its examination should exist.

Picric acid.—The fact that the shipping of this substance is surrounded with rigid specifications and is unduly expensive was pointed out.

Phenolphthalein.—It was suggested that the melting point of this substance be carefully determined. It was also considered advisable that the sulphonated salt be given official recognition.

Pine needle oil.—A question arose as to which variety was meant.

Potassa sulphurata.—The question of its standardization

was brought up. Its liability to deterioration and the simplicity of its manufacture were pointed out.

Quinine and urea hydrochloride.—The fact was noted that this salt turns gray very quickly.

Saccharin sodium salt.—Some discussion took place as to the propriety of recognizing this substance, and its extensive use in pediatrics was pointed out. There was a question as to why the sodium salt was selected, as the ammonium salt is preferred in Germany.

Uranium nitrate.—The question was asked: Why the nitrate was preferred to the acetate.

On motion the branch disapproved the admission of the following substances: Ammonium bifluoride, calcium chloride in hydrated crystals, diastase, erythrol tetranitrate, and the sodium salt of saccharin.

Several members asked why the revision committee did not purpose to admit ichthyol, piperazine, and chromium sulphate, all widely used substances. The fact that ichthyol is a patented substance was one answer.

Next were considered the proposed deletions, with the following comment:

Sulphurous acid.—Because of its popularity, this substance was favored for retention.

Aluminum sulphate.—This it was thought should be retained because of its extensive use, particularly in making solution of aluminum acetate.

Extract of digitalis.—It was considered that this preparation was more stable than the crude drug, besides being much used.

Extract of sumbul.—This was referred to as the most active preparation of musk root.

Ethereal oil.—In this connection arose the question as to what is Hoffman's anodyne, Hoffman's drops, etc. There seemed to be a quite even division as to whether the simple or the compound spirit of ether was meant. The retention of the oil was favored because it would continue to be prescribed.

The branch voiced an official protest against the deletion of the following: Sulphuric acid, aluminum sulphate, cataplasm of kaolin, cerate of lead subacetate, cerium oxalate, extract of digitalis, extract of sumbul, fluid-extract of digitalis, glycerite of iron, quinine and strychnine phosphates, lithium benzoate, lithium salicylate, rhubarb and soda mixture, ethereal oil, potassium sulphate, santonica, scammony, sodium nitrate, compound spirit of ether, syrup of iron, quinine and strychnine phosphates, compound syrup of hypophosphites, tincture of cardamom, tincture of ipecac and opium, tincture of fresh plants, santonin troches, ointment of galls, ointment of red oxide of mercury, ointment of potassium iodide, viburnum opulus, white wine, and red wine.

There was considerable general discussion of the proposed deletion of wines.

Mr. De Jonge said that many had reported to him their failure to make a standard tincture of opium from the granulated drug. He favored the use of the extract in making the tincture.

Mr. Murray sought information as to whether the preface of the Pharmacopœia would continue to state the limitation of the application of the standards to medicinal substances.

The opposition to a "skeleton" Pharmacopœia was strong. It was believed that to transfer the formulas for the much used compounds to the National Formulary would be to weaken the arguments of the propagandists for official medicaments.

Those participating in the discussion were Messrs. Raubenheimer, Diekman, Murray, Lehman, Mayo, Weinstein, Von Oefels, Arny, Niece, Mayer and Roemer, Chairman Hitchcock, and Secretary Craig.

A vote of thanks was extended to the U. S. P. revision committee for making public the lists of proposed admissions and deletions.

During the meeting Dr. Francisco Herrera, secretary of the Cuban National Association of Pharmacists, was introduced by Mr. Mayo, and told how the Havana organization protected the prices of specialties.

Philadelphia.—The reporting of the proceedings of the various National and leading State organizations in pharmacy and the collateral pursuits at their 1911 meetings made up the business of the meeting of the Philadelphia branch of the American Pharmaceutical Association, held October 13th.

Prof. J. P. Remington made a written report on what

had been accomplished by the American Pharmaceutical Association. Prof. C. H. La Wall reviewed the work of the Pennsylvania Pharmaceutical Association. G. M. Berlinger discussed the recent annual meeting of the New Jersey Pharmaceutical Association. And Dr. F. E. Stewart told of his visit to the 1911 meeting of the American Medical Association.

At the subsequent session of the scientific section, W. A. Pearson reviewed the work of the American Chemical Society. E. Vanderleed reported on the scientific features of the American Pharmaceutical Association's meeting; and C. G. Brinton reviewed the recent progress in methods of food analysis.

A resolution was adopted addressed to Governor Tener, endorsing L. L. Walton, of Williamsport, the present secretary of the Pennsylvania Board of Pharmacy for re-appointment to succeed himself as a member of the board.

Future meetings of the branch will be held on the first Tuesday of each month.

Co-operative Concern Refuses to Comply With N. A. R. D. Resolution.

At the recent meeting of the National Association of Retail Druggists a resolution was passed calling on the executive officers of each co-operative druggists' concern to give N. A. R. D. headquarters a statement of its financial condition. This action is of particular interest in Philadelphia because it is the home of the Philadelphia Wholesale Drug Company, probably the largest and best organized commercial association of retail druggists in the country. Although this concern has always been in most friendly relations with the National Association of Retail Druggists, its president and general manager, Frank R. Rohrman, has declared that he certainly would object to giving out any such information as that specified in the resolution. He declared that it had always been the policy of the management of the Philadelphia Wholesale Drug Company to furnish to individuals or organizations of retail druggists in cities and towns all over the country detailed information as to the methods, membership and policies of the company which would be of value to them in forming similar organizations for commercial purposes. "But information as to the financial condition of the company," he continued, "in my opinion is for the stockholders alone, and I certainly am opposed to following the course outlined in the resolution on that subject adopted at the 1911 convention of the National Association of Retail Druggists. It is against all business principles, and while the plan may have merit in its application to some enterprises in which retail druggists are interested financially, as far as the Philadelphia Wholesale Drug Company is concerned I am not in favor of it."

Raising the Grade in North Dakota.

The pharmacy law of North Dakota has been so amended that on and after January 1st, 1913, the qualifications for registration will include three years' experience and at least one year of work in an approved school or college of pharmacy; and on and after January 1st, 1915, two years' experience and graduation from such college will be required. The board is authorized to determine what shall constitute an approved school or college of pharmacy, but none shall be approved unless it shall furnish by a competent faculty of instructors a course of instruction for a full two-years' course of not less than six hundred hours given to lectures and recitations and two hundred hours given to laboratory work in the following subjects: Physics, chemistry (general qualitative, quantitative, organic), pharmacy (theoretical, practical dispensing), materia medica (physiology, therapeutics, posology, toxicology), botany, microscopy and pharmacognosy. Said course of instruction is to consist of not less than two terms in separate academic years of not less than thirty-two weeks of five days each for each term.

The law does not apply to trained nurses or persons in charge of laboratories or chemical departments of public hospitals when acting or engaged in the discharge of their duties as such.

"When you want medicine bad you want it good—get it also pure—in other words get it at Winger's." Thus does Winger's Drug Store, Euclid and Fifty-eighth street, Cleveland, O., advise the public.

Picturesque Description of One Drug Clerk.

Some hard things have been said about drug clerks—who are really about as fine a set of young fellows as one need wish to know—but what follows takes the rag off the bush, whatever that means. An unregistered man found himself in possession of a drug store in Pennsylvania and had some difficulty in getting a clerk for the salary the business could afford to pay; and he also had some difficulty with the board of pharmacy on account of conducting his business without a registered clerk in charge. In a letter to the secretary of the board he relates how he wired for a clerk—but let him tell his own story:

He came, and he was the most disreputable specimen of humanity that I ever saw. He came on a freight and had a collar on that had once been white and a shirt that had not been washed since the civil war. A pair of pants that when new would have been dear at \$1.25, one leg of those had been torn off about six inches above his shoe and the frayed edges were hanging, and I guess the other leg must have shrunk, because it was four inches above a pair of ily mated shoes without laces, a pair of dirty calves entirely innocent of socks, wore an old brown derby hat of the style in vogue fifteen years ago and had a coat that had belonged to some boy about twelve years of age. Now add to that picture a lean, hungry face, covered with about six weeks' growth of dirty, wiry beard, place in that face two eyes that resembled nothing more than two burned holes, caused no doubt from the use of dope, and you can imagine that I was some disappointed in the appearance of my clerk. I was also a little disgusted and some disappointed, and I asked the fellow what he thought I was running, a tramp's home or a hospital for incurables.

Well, to tell the truth, I was sorry that I said that to him, and all during his three months' stay in town I tried to make it up to him. He secured a job in a livery stable as chambermaid and wore the very same clothes all of the time, even to the same shirt, and was the butt of everyone. Well, at last he quit and bought himself some fairly respectable clothes, took a bath, bought some blue ointment, etc., got shaved and looked quite like a human being. He had more than enough money to buy the uniform, because he paid \$7 board at a hotel for three weeks after quitting his job, and during that time made no effort to secure work.

When he was all in he came to me again and offered to work for \$6 per week. I told him as kindly as possible that after working at the work in the livery stable that I could not hire him in my store. You know yourself that you would not do it. While I don't consider it any disgrace to work in such a place, that in a small town it would not do to place him in a drug store. I tried to get him another job, and he came in two nights later and wanted to pawn an old pair of glasses and a 50-cent ring for \$5 to get away from town on. I refused to take the junk but gave him 50 cents and told him he ought to be able to get the dollar necessary to pay his fare from the places that he spent his money, but he came back and shed some few tears and I gave him a dollar more.

Now that is the man who took it upon himself to inform on me. I don't hardly think the fellow did it of his own accord. I think that he was hired by a fellow who has even less right to be considered a man than he.

L. J. Cohen, once secretary of the Brooklyn Pharmaceutical Association, has returned to Baltimore and opened a store at 1105 Columbia avenue.

The Drug Clerk's Thanksgiving Dinner.

New York German Apothecaries' Society's Jubilee.

The sixtieth anniversary of the New York German Apothecaries' Society was celebrated by two festivals, the first a kommers and the second an entertainment with banquet and ball.

The kommers was held September 28th in the banquet hall of Terrace Garden, and was attended by more than 250 members and friends of the society. Among the distinguished guests were: Prof. Jacobi, the nestor of the German physicians in New York and president of the American Medical Association; Mr. McAneny, president of the borough of Manhattan; Mr. Sutro, president of the United German Societies; Prof. J. P. Remington, of Philadelphia; Prof. J. V. Lloyd, of Cincinnati; and Prof. H. P. Hynson, of Baltimore.

The kommers was opened and presided over by Dr. W. C. Alpers, who after extending a hearty greeting to all those present, introduced as speaker the honorary president of the society, Gustav Ramsperger, the only survivor of the twenty-five founders of the society. Mr. Ramsperger in a short address expressed his wishes for a happy and prosperous future for the society. In behalf of his fellow members C. F. Schleussner presented to Mr. Ramsperger a handsome loving cup bearing this inscription:

1851—1911

GUSTAV RAMSPERGER

Gründer und Ehren-Präsident

des

New Yorker Deutschen Apotheker-Vereins

zum

sechzigjährigen Jubiläum.

Prof. Jacobi was next introduced and gave a brief sketch of the practice of medicine during the last sixty years.

Dr. Alpers then made the jubilee speech.

Prof. Hynson, the next speaker, paid tribute to the influence the German pharmacists had had on pharmacy, not only in New York, but throughout the United States. His words were corroborated by Prof. Lloyd and Prof. Remington, the latter also mentioning the great number of German pharmacists who were at present members of the pharmacopœial committee of revision. Prof. Remington also spoke of the good fellowship or "gemüthlichkeit" so characteristic of the Germans.

Certificates as honorary members were presented to Profs. Jacobi, Remington and Lloyd by the presiding officer, Dr. Alpers. Although the proceedings of the society are conducted in the tongue of the Fatherland, Dr. Alpers, in addressing Profs. Remington and Lloyd, spoke in English, saying:

The pleasing and cheerful words that you have just addressed to us have gone to our hearts, and come back from there like a joyous and responsive echo. It is not often that we have Americans as prominent in pharmacy as you two, among us. Our society is a German one, and the official language here is the German tongue. We watch over German features and are proud of them, not because we dislike the English language, nor because we think less of things American. Our daily surroundings, our aspirations, our hopes in business, as in social matters, in fact all our daily activities are American, and we are Americans in every sense of the word. Indeed, no one may become a member of this society unless he is a citizen of the United States.

If yet we cling to German customs, we do so because our meetings are a refuge from our daily toil. Here we come back to the days of our youth; here we find that recreation that is needful to us; here we once more revel in those ideals which fill so completely the heart of the German youth; and we believe this change in language, this change in thought, this return to days long past and never to be recalled, gives us strength and encouragement, and in the enjoyment of German "gemüthlichkeit" we find ample recompense for our daily duties. And more than this, the intercourse between German and American civilization has increased from day to day during the last few decades. We have prized it here for sixty years, and we are proud that the spirit that has kept this society alive and made it grand, and given it influence and importance, has added greatly in bringing together the scientific bodies of the two great nations. To us Germans our new country is our bride, for whose life and honor we are ready to sacrifice all we have, but in our loyalty and affection for her we will never forget our loving mother across the sea, and always have ready for her a resting place at our hearth.

It is in this feeling of pleasure and pride that we welcome you tonight in our midst, you whom we believe to be the two most typical representatives of American pharmacy. You both have risen from the low position as apprentice in a drug store to high places in our profession. You, Joseph P. Remington, as chairman of the committee of the revision of the Pharmacopœia, have attained what I consider the highest honor that

American pharmacy can confer. And you, John Uri Lloyd, have gained an international reputation as scientist and author, and in commercial pursuits have not forgotten the sweeter and gentler sides of human nature, and depicted them in a masterful way in your beautiful novels.

It is, therefore, in this spirit of pride and friendship, which goes out from us to you, that we have decided to confer upon you both the honorary membership of the German Apothecaries' Society. We want to emphasize herewith our loyalty for American pharmacy and our admiration for American science. We want to have it understood that we are American in heart and soul, and further, we want to give expression to our personal admiration and love with which our hearts go forth to you as the best men that American pharmacy has produced. And finally, speaking in a broader sense, we wish to accentuate the bonds of friendship that exist among scientific men of the two nations, Germany and the United States, that broad and noble friendship which alone makes for high civilization, for better knowledge, for better understanding of all that is grand and ennobling in either country and that brings the two great nations closer and closer together in a common purpose. It is in this spirit that I hand you these diplomas, and I know that you will accept them in the same way.

Felix Hirseman then reviewed in detail the history of the society during the last sixty years.

Mr. Hauser concluded the speech-making part of the evening with a humorous address in which he spoke about sixty years of being a customer of druggists.

After these exercises the kommers proper came to its rights and many more pleasant hours were spent by the members. Vocal selections were rendered by several members, and by the Manhattan Male Quartette. A "bier-zeitung," containing caricatures of various members, and songs written especially for the occasion, had been prepared by Mr. Kantrowitz.

Those present were:

Henry F. Albert, Eugene Adler, Edward B. Amend, Adolph Amend, Carl G. Amend, Otto P. Amend, Philip C. Ackerman, William C. Alpers, K. Aschenbrand, Paul Arndt.

G. W. Blanchard, F. W. Baimers, William F. Brandt, C. A. Buchbinder, H. H. Blomeier, E. W. Ditrich, George Bley, Eugene F. W. Becker, Ernst A. Boetzel, Eric L. Boetzel, Ludwig Balles, Ernst A. Boettcher, Ernst Bilhuber, George Bruns, Henry Buch, H. E. Benedix, Henry J. Binder, Jr., A. Berg-haus.

Clarence G. Clark, Alfred I. Cohn, Hugh Craig, Dr. A. Cam-mitzer, B. C. Chatillon, Bruno R. Dauscha, John Dreyer, August Diehl, Wilhelm Dreves, Herbert C. Dienst, L. Wm. De-Zeller, George S. De Lacy, Clarence O. Douden.

August Eimer, H. E. Eisentrager, A. J. Franz, Edward Fuehrer, F. S. Frankfurter, Carl Fuchs, John C. Gallagher, Richard Gaupp, Paul F. Gebicke, Otto P. Gilbert, W. P. Gregorius, Leo W. Geisler, Sr., Leo W. Geisler, Jr.

F. E. Holliday, Felix Hirseman, Max Hirschberg, Hans-Houhlar, August E. Hahn, C. J. Heterheine, J. Joseph Herbert, F. F. Angelo Haase, G. E. Heuther, Eugene R. Hynard, H. P. Hynson, Carl Hauser, Robert Hahn, John Hundt, William Ise-mann, Adolf Imhof, Henry Jansen, Richard Jorgenson, H. V. Jarchow, D. A. Jacobs.

George Kleinau, Hugo Kantrowitz, W. A. Kempf, W. C. Koehler, Emil C. Krausche, William Kamiah, Carl Klippert, Charles A. Kalish, Ad. Klein, Dr. E. G. Kessler, H. C. Koehler, C. Khuen, Albert Koehler, E. J. Kennedy, A. A. Kirschner, E. Kuehnehan, P. Kneufel, Armin C. Krapf, John Krack, Julius Krause, Julius Kramer.

Otto A. Leister, M. E. Lippold, H. F. Ludermann, Frederic-Linnig, Otto Lenz, E. H. Lubbers, Henry C. Lovis, Robert S. Lehman, Fred Lange, John U. Lloyd.

Edward A. Mueller, Edward Miller, Louis Moes, Otto Maier, Charles H. Mierrow, C. A. Mayo, Philip Matty, Adam McKenna, F. L. McCartney, Woldemar Nemser, John Oestreich, Franz Olyvet.

Fred H. Plate, G. F. Phillips, F. A. Plump, Theo. Pundt, A. Plumpton, C. W. Parsons, Otto Raubenheimer, H. Kehse, Ernst F. Ruppe, Herman Reaske, Emil Roller, William Raabe, G. T. Rieffli, George Rodemann, Joseph Rupprecht, William Roschen, Louis Riegel, Gustav Ramsperger, Joseph P. Remington.

S. V. B. Swann, John A. Schmitt, Alfred Schletter, Robert L. Seifert, C. F. Splittoir, F. P. Schmidt, Carl Stroening, K. Schoenfeld, Carl Schur, Fred. Schaefer, W. L. Schultz, S. Schoenfeld, W. A. Schmidt, G. E. Schneider, C. H. Schmidt, Herman Schmelz, Adolph Schmidt, Henry Schierer, J. A. C. Stadler, Emil Schultz, Harry J. Schumacher, F. H. Sieman, H. Sellheim, F. W. Stechmann, Theodor Sutro, C. F. Schleussner, G. C. P. Stolzenburg, Frederic J. Suhr.

R. H. Timmermann, Philip Toussaint, Fred Trau, Otto Ull-rich, Gustav Unger, W. E. Vogt.

David Westheimer, Carl Wippermann, Fred H. Weyer, Carl Wiebing, L. Watermuelder, Herman Walter, Joseph Weinstein, Herman Weller, C. W. Wagner, J. Weidenfeld, C. P. Wimmer, R. C. Werner, John W. Wurthmann, John F. Wurthmann, J. E. Willis, Theodore Werner, W. H. Weygandt, Charles F. Zinckgraf, and John H. Ziegler.

BANQUET AND BALL.

An evening entertainment with banquet and ball which was given at the same place on the evening of October 12th, concluded the celebration. The musical part of the elaborate program for this occasion was in the hands of the Lederhaus orchestra, the Manhattan Ladies' Quartette, and Miss Kirmse, a harpist, while Miss Frey and the comedian, Mr. Stolberg, gave humorous recitations.

An elaborate dinner and dance, which followed the enter-

tainment, kept the members and their friends together for many more hours. Among the guests present were Ewan McIntyre, honorary president of the College of Pharmacy of the City of New York; Mr. Lascoff, president of the New York County Pharmaceutical Society, and Mr. Calcagno, of the New York Italian Pharmaceutical Society.

The committee in charge of the jubilee celebration was composed of O. P. Gilbert, H. F. Albert, Dr. W. C. Alpers, E. C. Goetting, Felix Hirseman, H. Jarchow, Hugo Kantrowitz, Dr. C. F. Klippert, R. S. Lehman, G. Leinecker, G. T. Riefflin, C. F. Schleussner, and S. V. B. Swann, and to these members much praise is due for the success of the occasion.

Regular Meeting of the G. A. S.

The regular monthly meeting of the society took place October 5th, President Kleinau in the chair.

O. P. Gilbert reported on the special meeting held September 28th, in which Profs. Jacobi, Remington and Lloyd were unanimously elected honorary members of the society.

After the regular routine business had been disposed of, President Kleinau reported that the New York board of health had brought charges against several druggists, who were said to have used tartaric acid instead of citric acid in manufacturing solution of magnesium citrate. Prof. Wimmer, of the College of Pharmacy of the City of New York, Columbia University, at the request of President Kleinau, then gave some interesting details about the manufacture of this preparation. His lecture was received with much applause, and was then thoroughly discussed by Dr. Alpers, Dr. v. Oefle, Mr. Raubenheimer, Dr. Drobegg, Mr. Roller, and two attorneys-at-law, Messrs. Kalish and Herrold.

After President Kleinau had thanked Prof. Wimmer for his lecture, on the recommendation of Mr. Schaefer a committee of five members was elected for the purpose of nominating candidates for the executive force of the society to be elected at the December meeting. Messrs. Schaefer, Hirseman, Swann, Diehl and Schleussner were chosen as members of this committee.

After, by request of Mr. Swann, the society had thanked Messrs. Alpers, Kantrowitz, Riefflin and Gilbert for the excellent work they had done in arranging the details of the fest-kommers, the meeting adjourned.

Kings County Society.

A well attended meeting of the Kings County (N. Y.) Pharmaceutical Society was held on the afternoon of October 10th, President Douden in the chair.

Treasurer Paradis reported that the balance of the society was \$487; and of the college over \$16,000.

The principal subject considered at the meeting was the proposed changes in the Pharmacopœia. A list of the articles which it proposed to drop and of those to be added had been sent to the members several weeks in advance of the meeting and suggestions in writing invited from those who might not be able to attend.

Mr. Raubenheimer (who is a member of the revision committee) explained the procedure as to the formation of the list referred to. A discussion of the list followed, the result of which was the voicing of objection to some of the proposed deletions, and of some of the proposed admissions, and the suggestion of still other articles for admission.

An Extended Course in Pharmacy Fails of Support.

Fordham University, of this city, proposed to establish this season a department of pharmacy in which the courses were to extend over three and four years, respectively. A great number of persons seemed anxious to enter, but when the conditions became fully known, failed to do so. Great pressure was brought to bear on the officers to reduce the time, but they held to the view that it was better to have no pharmacy department at all than one which would not establish such a standard as they had contemplated.

D. Ullamena, lately manager of Legal's stores on Third and Seventh avenues, this city, has purchased Maschini's store at One-hundred-and-fifteenth street and First avenue.

Westchester County Association.

A regular quarterly meeting of the Westchester County (N. Y.) Pharmaceutical Association was held at Tarrytown, October 11th. The attendance was a trifle below normal.

After the reading and approval of the minutes of the summer meeting, and the reading of several communications of regret from members unable to attend, the reports of the standing committees were heard. W. H. Leonard, of Tarrytown, reported that no matters had been brought to the attention of the executive committee.

For the committee on registration, J. M. McCullough, of White Plains, told of the last moments of the recently attempted Turley bill. He voiced the opinion that there would be other attempts to enact a similar measure. F. A. Russell, of Tarrytown, said that the committee should keep in close touch with the legislative committee of the State association.

Mr. Russell also presented the facts of the existing telephone conditions. The operating company he had found to be opposed to paying better commissions because the toll rates had been reduced by the public service commission. He advised his hearers to refrain from signing any new contracts until the company was willing to concede better terms. If, said he, the druggists would make it plain that they must be paid for their services to the telephone company something more than the ridiculous commission of 10 per cent., and would refuse to put in slot machines until a better compensation was forthcoming, the company would come to terms. Mr. Russell advised working in co-operation with the telephone bureau of the National Association of Retail Druggists.

This report was adopted with every show of approval for the sentiments expressed.

Robert Boyd, of Tarrytown, was elected a member of the association.

President John Roemer, of White Plains, presented a communication on the relation of the pharmacy law to manufacturers, wholesalers, and physicians' supply houses. To begin with, he found fault with that portion of the law which requires retailers to sell only standard preparations under official names but permits wholesalers and manufacturers to sell deficient preparations if they be so labeled. This, he said, permits jobbers to unload spurious goods on unsuspecting dealers who have no redress if they pass out the same goods. As an instance he told of purchasing some extract of vanilla represented to be U. S. P. quality. The container was not labeled as to the alcoholic content, and the maker told him it contained but 47½ per cent. of alcohol. He estimated the alcohol present at 6 per cent. When he asked the manufacturer why the label was deficient he was told that the law did not apply to vanilla extract. The law, declared Mr. Roemer, should give to retailers the same privileges enjoyed by wholesalers, and the Westchester association should work to have such equality brought about.

This occasioned some discussion as to the best way in which to secure the desired changes in the law. Hugh Craig, of THE DRUGGISTS CIRCULAR, explained the manner in which the State association by conference under the auspices of its legislative committee received and considered the legislative desires of local organizations. Mr. McCullough expressed his willingness to bring the matter before the State association. At the suggestion of Mr. Barr he will see that Mr. Roemer's communication goes before the State committee.

Relative to the position of the physicians' supply houses Mr. Roemer told of his experience with one of these concerns. Having learned from his physician neighbors of the cheapness of this firm's wares he ordered through its traveler some aromatic spirit of ammonia, spirit of nitrous ether, spirit of nitroglycerin, fluidextract of belladonna root, compound spirit of ether, and tablets of strychnine. The compound spirit of ether was not supplied. The spirit of nitrous ether assayed 25 per cent. below standard; and the aromatic spirit of ammonia was only about two-thirds official strength. After much correspondence with the house, with evasion and delay on its part he told the representative that the house was crooked, and the matter was closed apparently for all time.

From a manufacturing house Mr. Roemer bought solution of aluminum acetate which was purported to be of N. F. quality. It assayed but 6 per cent. of basic aluminum acetate; and his inquiries of the manufacturer led to the fact that barium carbonate was used instead of calcium carbonate, and that the manufacturer was not sure of the

strength of the finished product. He said that his view of the trustworthiness of the average manufacturing house was pessimistic. And he had known where a physician required seven quarter-grain hypodermic tablets of morphine sulphate of a certain make to get the desired result.

He called upon the association to consider and endeavor to correct these matters.

From 2:15 to 3:45 p. m. the meeting was adjourned while those attending enjoyed dinner.

The next meeting will be held at Yonkers, January 10th.

New York County Society.

At the meeting of the New York County Pharmaceutical Society held October 11th in this city, Prof. George C. Diekmann lectured on the subject of "The Testing of U. S. P. Substances." There was a fair attendance and all present listened with the greatest attention to Prof. Diekmann, who showed how comparatively easy it is to ascertain the quality, purity and strength of most of the pharmacopœial substances by simple tests. He also emphasized the fact that if pharmacists made it a practice to test their preparations, they would often avoid serious annoyance and inconvenience.

Among the many interesting tests shown were those distinguishing calomel and white precipitate, beechwood creosote and coal-tar "creosote," and tannic and gallic acids. Several tests for coal-tar products and alkaloids were also shown.

After the lecture a discussion ensued and interesting remarks were made by Messrs. Raubenheimer, Latham, Weinstein, Holler, and Lascoff, all emphasizing the practical value of tests to pharmacists. The importance of having proper utensils, measures and weights as part of the equipment of every pharmacy was also declared.

The botanical outing which was to be held by the society October 22d, under the supervision of Prof. William Mansfield of the College of Pharmacy of the City of New York, was postponed because of the inclemency of the weather, and will take place in the near future.

Enforcing the Poison Law in Pennsylvania.

The Pennsylvania board of pharmacy is proceeding against dealers in paints and in chemicals used in the arts who are charged with selling these articles without complying with the poison law. About seventy-five warrants have already been served in the course of the crusade on dealers in Philadelphia.

L. L. Walton, secretary of the board, makes the following statement:

The Pennsylvania Pharmaceutical Examining Board took action looking to the strict enforcement of the State's poison statutes; vigorous prosecution will be made of all dealers who fail to comply with them.

Reports received indicate gross negligence upon the part of dealers in various parts of the State in selling the commonly used drugs and chemicals. The poison laws require that every drug, chemical or preparation liable to be destructive to adult human life in quantities of sixty grains or less must have affixed to the package sold a label upon which appears the word "poison," and the name and place of business of the seller. The dealer must satisfy himself that the poison is to be used for legitimate purposes before delivering the same. If the article is liable to be destructive to adult human life in quantities of five grains or less, then the dealer must also register the sale in a book kept for that purpose.

Sales of morphine, strychnine, prussic acid, arsenic and carbolic acid may only be made at retail to persons of legal age, who must be respectable inhabitants of the town or place in which the sale is made. Each of these articles when sold must be labeled "poison" and the sale entered upon a register kept for that purpose. The name of the article, name and residence of the purchaser, the quantity sold, the name of the person making the sale and the date thereof must all be entered in the register.

It is reported that many dealers who thus far had not been arrested on the charge of failing to comply with these restrictions have since been adhering strictly to the letter of the law, while some have been found who no longer handle the articles in question.

Hay's Drug Store, 501 Congress street, Portland, Me., has been purchased by its manager, Arthur G. Spear. This is a very old store, mention of which is made in the Golden Jubilee number of the CIRCULAR. It was established by A. G. Schlotterbeck, and was conducted by the Schlotterbeck & Foss Company and by Bowen & Turner before it passed into the hands of the Hay corporation.

Philadelphia College Meeting.

The first pharmaceutical meeting of the Philadelphia College for the season was held October 16th, W. L. Cliffe presiding.

It was occupied with a discussion of the proposed changes in the forthcoming Pharmacopœia. George M. Beringer, of Camden, N. J., opened the discussion with a paper entitled "The Pharmacists' Plea for a Rational Pharmacopœia." He was followed by Otto Raubenheimer, of Brooklyn, N. Y., who read a paper on "The Inconsistencies of the List of Proposed Deletions."

Chairman Remington explained that the list of additions and deletions made public was only tentative, and that already changes had been made therein. He also discussed the decisions of the International Congress at Brussels and declared that these findings did not necessarily mean that every Pharmacopœia should adhere to them. He advocated that every country should decide for itself the details of its pharmaceutical manipulation.

Harry P. Busch, representing the wholesale and manufacturing interests, discussed the question of having the Pharmacopœia contain standards for articles that are no longer in common use, as well as those being used regularly. The wholesale and manufacturing interests were steadily having calls for preparations that are generally regarded as obsolete, and the question was particularly pertinent in its application to the coming ninth revision because this would be the first revision since the government had adopted it as a standard. Consequently, he stated, the manufacturers were bound to observe its standards and that therefore standards for articles no longer in general use should be maintained for the guidance of these interests. He expressed the belief that standards, once created, should be retained owing to the relation of the Pharmacopœia to commercial interests.

In the opinion of Prof. Henry Kraemer, the test of a Pharmacopœia was the getting rid of the obsolete, and he declared no previous revision compared in this respect to the ninth. The medical interests, he said, wanted a small book so that the attention of the younger practitioner could be directed to a limited number of preparations which he could use. The attention of pharmacists, he explained, was centered on processes with the result that every Pharmacopœia had to be in the nature of a compromise to conform with the views of the government, the physicians, the pharmacists and the manufacturing and wholesale interests. "And I know," he continued, "that excellent work is being done by Chairman Remington in his committee to satisfy all of these interests. I can safely say that we are only at the beginning of this work on the ninth revision, and that it will be generally satisfactory. The chairman is to be congratulated on the work as it has been carried on up to this time."

Another member of the committee on revision, Dr. H. C. Wood, Jr., declared that not enough articles had been left out of the Pharmacopœia. "As physicians," he said, "we want a book that will represent the forefront of medical practice. It should be primarily a book of medicine, and I am convinced that the things dropped from the Pharmacopœia will cease to be prescribed. The government simply adopted the Pharmacopœia because there was no other standard."

In closing the discussion, Chairman Remington declared that the present committee was the most representative that had ever undertaken the work of revision. "Most of my gray hair," he said, "has come in the last year, but I want to say that at last we have gotten all of our ideas together. We are always glad to hear comments and receive suggestions, but now we want to stop criticisms of our work, particularly when those criticisms are ancient and the point to which they refer has already been taken care of in some cases just as they suggest, but in any event entirely with the approval of the majority."

The president called attention to an exhibit of drugs and specimens which prompted some discussion. One of these specimens was a Barbadoes aloe, a portion of a shipment received by a local manufacturer, and the first received in many years from the Barbadoes which had really been raised there. It was explained that many had believed that the term "Barbadoes aloes" was a misnomer in recent years, as some reports stated that none were raised there for the market. Professor Kraemer stated that he understood that this industry was being revived and that Barbadoes aloes eventually would again be regularly upon the market.

Philadelphia Association of Retail Druggists.

The chief topic discussed at the meeting of the Philadelphia Association of Retail Druggists held Friday evening, October 6th, was the attitude of the Philadelphia newspapers in handling the stories of the work which the board of pharmacy is doing to prevent illegal traffic in habit-forming drugs. At a previous meeting of the association, Frank W. Fluck, a former president, was emphatic in declaring that the character of the reports in the newspapers might make it appear to the lay reader that the retail druggists generally were prone to indulge in the business of supplying the victims with these drugs when in reality the retail druggists, with possibly one or two exceptions, were making every effort to live up to the spirit as well as the letter of the law and were giving the board every assistance possible in breaking up the traffic. He moved at that time that the secretary be instructed to send letters to the press, pointing out these facts to the respective editors and asking them in the future not to put the odium of this inhuman traffic upon the retail drug trade.

Christopher Koch, Jr., president of the association and vice-president of the board, who has personally conducted the campaign, was opposed to such action and declared at the meeting on Friday evening that such a letter would only tend to antagonize the newspapers which had done most excellent service in helping to break up the traffic which the board was fighting. The motion was finally amended so as to provide that the press committee call on the editors and verbally explain the wishes of the retail drug trade.

It was the general opinion that the narcotics which still find their way into illegal trade are brought in by agents from cities outside of Pennsylvania.

Another interesting feature of the meeting was the discussion of a recommendation by the executive committee that the association endorse a proposition from the Drug Club that for a reduced rate the members of the association become "house members" of the club, with all the privileges except voting and holding office. This recommendation was approved, and it is expected that at least 150 new members in the retail drug trade will be secured.

A motion that the association establish an office in the district of the city where the majority of the wholesale drug houses and the offices of some manufacturers in the trade are located was referred to a special committee, with instructions to investigate and report.

D. J. Reese, chairman of the Pennsylvania and the Philadelphia delegations to the recent N. A. R. D. convention at Niagara Falls, gave an interesting report of the convention from a local standpoint.

An evidence of the steady interest in the affairs of the association was the election of twelve new members.

Public Lectures at Philadelphia College.

This session's series of special lectures for the students of the Philadelphia College of Pharmacy, to which the public will be admitted, will be given according to the following schedule:

November 6th: "Bacteriology in Its Relation to Public Health," by Randle C. Rosenberg, M. D.

November 20th: "Medicinal Plants Growing in the Vicinity of Philadelphia" (illustrated), by Stewardson Brown.

December 4th: "Recent Progress in Electrochemical Analysis," by Edgar F. Smith, Ph. D., LL.D.

December 18th: "The Drug Markets of the World," by Albert Plaut.

January 5th: "Dyewoods and Dyewood Extracts," by T. Chalkley Palmer.

January 19th: "The Establishing of Legal Standards for Foods and Drugs," by William Frear, Ph. D.

February 9th: "Present Problems in State and National Pharmaceutical Legislation," by John C. Wallace, Ph. M.

February 23d: "Homeopathic Pharmacy," by Thomas H. Carmichael, M. D.

March 8th: "Serums, Vaccines, Bacterins and other Biologic Products," by Charles E. Vanderkleed, B. S.

March 22d: "The Chemistry and Technology of Baking," by L. H. Baekeland, Ph. D.

April 5th, 1912: "Window Dressing for Pharmacists," by H. Harfman.

Queer Orders from Down South.

Those who love their "Uncle Remus"—and none know him but to love him—have noticed that his Sea Island negro (Daddy Jake, as we recall it, is his name) used a different lingo from the up-country darkey. Native Southerners who have no difficulty whatever in understanding all "Uncle Remus" language, are stumped by much of what "Daddy Jake" says. Illiterate drug store orders when written by native white Americans are bad enough, and those written by negroes are even worse; what, then, shall we expect, from the illiterate negroes who live on the small islands along the coast of South Carolina—these people, with their strange dialect and peculiar appearance?

"The Pill Shop" is the name emblazoned on the illuminated sign identifying the store of R. J. Frick, Seventh and Main streets, Louisville, Ky.

C. C. Gautier, of Greencastle, Ia., was seriously injured last month by the explosion of a tube of nitrous ether.

A "Spicy" Wiley Story.

A little story was picked up here in town by a CIRCULAR man the other day which ought to convince any who doubt that Dr. Wiley is sincere in his expressed desire to be just to all interests even though he may not be infallible.

There is a man who puts up a prepared mustard. He received a notice from Washington in which it was stated that his mustard product contained more than the allowable proportion of mustard pods, hulls or shell. He knew that he was careful to use good mustard which was as free from shell as any commercial mustard ever is. He employed a chemist to make an analysis of his product. This chemist reported that it did not contain as much as the allowable proportion of shell.

The manufacturer did not like Dr. Wiley, anyhow, and here was evidence that he was persecuting a man who was trying to, and was, obeying the food and drugs law. He went to another chemist for advice. This second chemist made an analysis of the product and found that it was all right. He then made another analysis, this time using the official method for the guidance of government chemists, and according to this analysis, the mustard did contain too much shell. Here was an interesting situation. Close investigation showed that there was an error in the government method of analysis, in that those who followed it weighed the shell particles with adhering oil, the latter making their weight appear more than double what it really was.

This explanation was sent to Dr. Wiley with the request that as a matter of justice the mustard be passed, that the official method of analysis be changed, and that such reports as had been sent out from the bureau of chemistry adverse to the brand of prepared mustard under consideration be followed by letters explaining the error.

This request Dr. Wiley granted with pleasure and alacrity, much to the astonishment of the manufacturer, who was under the impression that all governmental action was so tied up with red tape as to become practically inaction.

That manufacturer is now one of the staunchest supporters in the trade of Dr. Wiley and of the food and drugs law.

Montana Association.

At the twenty-first annual meeting held recently, at Hunters Hot Springs, the Montana Pharmaceutical Association nominated to the governor for his consideration in appointing a member of the board of pharmacy, T. M. Kehoe, of Billings (the present incumbent); J. M. Seaman, of Livingston; J. A. Kelly, of Lewistown; Lee Warren, of Billings; and Louis Driebelis, of Butte.

Officers were elected as follows: President, J. M. Seaman, of Livingston; vice-presidents, A. C. Rocher, of Bozeman; Lee Warren, of Billings; and C. E. Mollett, of Bozeman; secretary, W. R. Montgomery, of Butte; treasurer, A. D. Rose, of Bozeman; members of the executive committee, C. R. Fuller, of Anaconda; Howard Rockefeller, of Butte; George Husted, of Livingston; and Frederick Woehner, of Great Falls.

Next year's meeting will be held at Boulder Springs.

The Druggists as Others See Him.

The following pen-portrait of the English drug-storeman is one of a series by Holland in *John Bull*:

Another awe-striking personality is the chemist. He is generally very shortsighted, and reads a prescription as if he were sniffing the note-paper. It is at such a moment that his large, dome-shaped head shows to advantage. Its well-washed baldness catches the sun almost dazzlingly, and even reflects the red and green bottles in the window. You can not but admire him for the wealth of pharmaceutical lore he has necessarily at his command, and, apart from this, you are always completely wonderstruck at his faculty for solving hieroglyphics and rendering their interpretation in blithering form. He is never a fashionable man, and he is seldom conversational. But you enjoy visiting him, nevertheless, for his shop is clean and aromatic. You even yearn to be a chemist, and to live your life amid a hundred different perfumes. But the yearning is only transient.

A colored woman has sued a Chattanooga (Tenn.) druggist to recover damages for injuries resulting from burns caused by the ignition of a 70-per cent. alcoholic rheumatism "rub," which the victim applied before an open-grate fire.

Two State Association Presidents.

It is fitting that neighbors engaged in the same calling should be acquaintances, hence we introduce to each other and to the readers of the CIRCULAR in general the presidents of the State pharmaceutical associations of New Jersey and New York:

President of the New Jersey Association.

If it were not for the examples of successful druggists in metropolitan centers, in the smaller cities and in towns and villages throughout the country, one who hears the oft-reiterated cry of the malcontents that the drug business has gone to the bow-wows, would in time begin to believe that such a thing as making money behind the counter of a retail drug store was to be classed with the lost arts. Not every one can walk about the streets and pick up yellow-backs, or even take an established well-paying business and keep it going, but almost any man who has

CHARLES B. SEARS.
President of the New York
Pharmaceutical Association.

WILLIAM E. WARN.
President of the New Jersey
Pharmaceutical Association.

within him the elements which would make him successful in any profession or mercantile pursuit can go into the drug business and do as well there, other things being equal, as he could anywhere else.

One of the successful business men of a near-by small city of New Jersey is William Edgar Warn, of Keyport. The fact that Mr. Warn chose the drug business as his life's work seems to have had no particular effect—accelerating or deterrent—upon his rise as a business man. He has stuck to his store close enough to give it the attention it needs, but not so close as to warp his character and make him unfit for other tasks and pleasures of life. for he has done a little something in municipal politics, in banking, in secret orders, and, of course, has not been neglectful of the duty which every man owes to the profession or trade which yields him his living, and so has joined the American Pharmaceutical Association as well as his State organization. In the latter he has given such a good account of himself that he has risen to its highest office, having been elected president of the New Jersey Pharmaceutical Association—the oldest organization of its kind with a continuous history in existence—at its meeting held at Asbury Park in June. He joined the American Pharmaceutical Association in 1886, being the only member of that body in his town. For thirty-seven years Mr. Warn has been a reader of the CIRCULAR, which, he says, is a welcome friend and one he should not like to lose.

Just a few words here as to who this man really is. Well, to begin at the beginning, he is a native New Jerseyman of pre-Revolutionary stock, having been born at South Amboy February 5th, 1853, a member of the Warn family which came from England to America in the eighteenth century. He had attended the public schools of Keyport as well as private schools, acquiring a good preliminary education. He began the study of pharmacy under Dr. William Hodgson, a local druggist and physician. After four years of preparation he was advised by his preceptor that he was prepared to launch out upon the sea of business for himself, so on June 12th, 1872, when less than twenty years old, he opened a drug store at Keyport, and has remained in the business at that place ever since.

Being a public-spirited man Mr. Warn was drawn into local political affairs. He was elected a member of the

board of commissioners in 1892 and was treasurer of that body for sixteen years. When Keyport became a borough in 1908 Mr. Warn was elected one of its councilmen, an office which he resigned this year to accept that of mayor. He was one of the organizers and a director of the People's National Bank, of his town, of which he became president in 1901, an office he continues to fill. Mr. Warn is a Mason, an Odd Fellow, and a member of several other secret, benevolent and insurance orders.

In business Mr. Warn claims to be a progressive conservative. As a pharmacist he endeavors to keep abreast of the newest ideas. As a citizen he is alive to the needs of his community. Last, but by no means least, it may be stated that he married Miss Laura B. Wood, of Charles City, Iowa, October 10th, 1898, and that his home life is of the happiest kind.

President of the New York Association,

Snow could not cool the ardor nor north winds lessen the spirit of the eighty-nine young men and two young women who constituted the graduating class of the College of Pharmacy of the City of New York in 1888—the year of the big blizzard. In this class there were four men who have since attained among other distinctions that of membership in the New York State Board of Pharmacy. These are Dr. George C. Diekman, the present president of the board, Frederick P. Tuthill, Otto Raubenheimer, and Charles B. Sears. One of these has reached even a higher office, for at its meeting held last June at Alexandria Bay, the New York State Pharmaceutical Association chose as its president Charles B. Sears, of Auburn.

Mr. Sears is not quite fifty (and in these times that is saying that he is still a young man), having been born in 1862. When eighteen years of age he began his career in the business in which he has since achieved so much honor in the store of S. C. Suydam, at Baldwinsville, this State. Four years later the first New York State Board of Pharmacy, which had jurisdiction over all the State except the counties of New York, Kings and Erie, came into being, and at its first examination, held at Syracuse, October 14th of that year, it examined a class of twenty-two applicants, of which number sixteen passed, among them being Mr. Sears. As good luck would have it, the number of his certificate was 13. Let's see: Didn't William Simpson draw badge number 13 at the meeting of the American Pharmaceutical Association the year he was elected its president, as well as the year before? There are some combinations that just simply can't be beaten.

In business Mr. Sears is secretary and treasurer of the Charles H. Sagar Company, of Auburn, a half interest in which concern he purchased in 1893. He was recently elected president of the New York State organization of "Rexall" druggists, and is a believer in concentration and co-operation in business.

Massachusetts College of Pharmacy.

The forty-fifth annual session of the Massachusetts College of Pharmacy opened September 25th, with the largest enrollment in some years. The building has been renovated during the summer and much new apparatus installed.

Alfred W. Balch, Ph. G., M. D., has been appointed professor of analytical and organic chemistry; Dr. Henry J. Perry has been advanced from assistant professor to professor of bacteriology, and Thomas J. O'Brien, Ph. G., M. D., is the acting dean.

Eta Chapter, Phi Delta Chi fraternity, gave a smoker to the students on Friday evening, September 25th, at which Dr. O'Brien was the guest of the chapter, and made an address.

Weak Spirit of Peppermint in Massachusetts.

Some specimens of spirit of peppermint collected by the Massachusetts Board of Health in August, were reported to assay as follows:

From C. A. Nelson, of Haverhill, "44 per cent., U. S. P. strength."

From N. C. Tozier & Co., of Haverhill, "67 per cent., U. S. P. strength."

From R. B. Quinland, of Boston, "71.5 per cent., U. S. P. strength."

From S. A. Epstein, of Boston, "71.3 per cent., U. S. P. strength."

News of the Pharmacy Boards.

List of Board Secretaries,

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

- ALABAMA—February 13th, at Birmingham. E. P. Galt, Selma.
- ARIZONA—November 8th, at Phoenix. A. G. Hulett, Phoenix.
- ARKANSAS—J. F. Dowdy, Little Rock.
- CALIFORNIA—December 5th, at Hartford. J. A. Leverty, Bridgeport.
- COLORADO—S. L. Bresler, Denver.
- CONNECTICUT—December 5th, at Hartford. J. A. Leverty, Bridgeport.
- DELAWARE—N. C. Downs, Wilmington.
- DISTRICT OF COLUMBIA—January 11th and 12th, at Washington. S. L. Hilton, Washington.
- FLORIDA—January 16th and 17th, at Jacksonville. D. M. Ramsaur, Palatka.
- GEORGIA—C. D. Jordan, Monticello.
- ILLINOIS—November 23d, at Chicago. F. C. Dodds, Springfield.
- INDIANA—January 9th and 10th, at Indianapolis. W. H. Fogas, Mt. Vernon.
- IOWA—December 5th, at Des Moines. E. J. Moore, Des Moines.
- KANSAS—November 15th, at Hays. W. E. Sherriff, Ellsworth.
- KENTUCKY—J. W. Gayle, Frankfort.
- LOUISIANA—F. E. Earhart, New Orleans.
- MAINE—December 13th and 14th, at Augusta. F. W. Bucknam, Skowhegan.
- MARYLAND—Ephraim Bacon, Roland Park.
- MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
- MICHIGAN—November 21st to 24th, at Grand Rapids. J. J. Campbell, Pigeon.
- MINNESOTA—January 15th and 16th, at Minneapolis. C. T. Heller, St. Paul.
- MISSISSIPPI—L. H. Wilkinson, Greenwood.
- MISSOURI—November 13th, at St. Joseph. C. E. Zinn, Kansas City.
- MONTANA—April 9th, at Helena. S. J. Coffee, Missoula.
- NEBRASKA—A. V. Pease, Fairbury.
- NEVADA—R. L. Prouty, Tonopah.
- NEW HAMPSHIRE—F. H. Wingate, Nashua.
- NEW JERSEY—January 18th and 19th, at Trenton. H. A. Jorden, Bridgeton.
- NEW MEXICO—A. J. Fisher, Santa Fe.
- NEW YORK—W. L. Bradt, Albany.
- NORTH CAROLINA—December 5th, at Raleigh. F. W. Hancock, Oxford.
- NORTH DAKOTA—March 19th, at Fargo. W. S. Parker, Lisbon.
- OHIO—F. H. Frost, Columbus.
- OKLAHOMA—January 9th and 10th, at Oklahoma City. J. C. Burton, Stroud.
- OREGON—F. C. Pozzi, Portland.
- PENNSYLVANIA—November 10th and 11th, at Philadelphia and Pittsburgh. L. L. Walton, Williamsport.
- RHODE ISLAND—December 5th, at Providence. J. E. Brennan, Pawtucket.
- SOUTH CAROLINA—November 15th, at Abbeville. F. M. Smith, Charleston.
- SOUTH DAKOTA—E. C. Bent, Dell Rapids.
- TENNESSEE—I. B. Clark, Nashville.
- TEXAS—January 16th, at Austin. R. H. Walker, Gonzales.
- UTAH—January 16th and 17th, at Salt Lake. W. H. Dayton, Salt Lake.
- VERMONT—D. F. Davis, Barre.
- VIRGINIA—January 23d, at Richmond. T. A. Miller, Richmond.
- WASHINGTON—P. Jensen, Tacoma.
- WEST VIRGINIA—A. Walker, Sutton.
- WISCONSIN—January 16th, at Madison. Edward Williams, Madison.
- WYOMING—C. B. Gunnell, Evanston.

Colorado Board.

At the September meeting of the Colorado Board of Pharmacy the following applicants for registration passed the examination:

J. B. Anthony, of Colorado Springs; Philip Berland, Frederick Doyle, and G. L. Edwards, all of Denver; C. J. Elz, of Boulder; F. A. Gribbling, of Denver; F. G. Lennon, of Manitou; W. A. Lusk and J. L. Singleton, both of Denver; and H. E. Wolte, of Colorado Springs.

District of Columbia Board.

Ten applicants for registration were examined by the District of Columbia Board of Pharmacy at its meeting held October 12th and 13th, five being successful. The successful ones are:

G. W. F. Boyd, C. I. Hanback, Gail E. Nelson, D. B. Payne, and L. C. Thyson.

The next meeting of the board will be held January 11th and 12th.

Illinois Board.

Seventy-five persons applying for registration as pharmacists were examined by the Illinois Board of Pharmacy at a meeting held at Chicago in September. Twenty of these were successful. Twenty out of thirty-eight persons applying for registration as assistants on the same date passed the examination. The successful ones are:

As pharmacists—A. J. Alexa, C. S. Eftaxopoulos, E. J. Halfacre, Raphael Jacobson, E. W. Jaworski, L. Kallberg, Frank Kremer, Jr., L. A. Marks, Vincenzo Marzano, R. J. O'Brian, R. J. Orr, Vito Pisani, Wolf Rosenberg, R. S. Scott, and L. L. Tabenski, all of Chicago; C. C. Gustine, of Canton; H. H. Heidbreder, of Quincy; C. M. Lynds, of Moline; B. S. Schildberg, of Dixon; and R. I. Wisman, of Quincy.

As assistants—John Allegretti, H. C. Babbitt, F. B. Balmer, E. A. Deming, Maurice Fitzgerald, Harry Hurwich, O. M. Johanson, Babina Kaczynska, L. N. Koch, J. R. Lyzywek, E. O. Morrison, Harry Notov, H. G. Patterson, M. L. D. Spikings, A. J. Stritesky, M. R. Tout, and R. T. Walker, all of Chicago; E. R. Abbott, of Bloomington; J. A. Dorjahn, of Blue Island; and W. A. Grau, of Aurora.

Local registration was granted to H. F. Forrest, of Minoaka; and L. D. Lyons, of Cuba.

The next meeting of the board will be held at Chicago, November 21st to 24th.

Massachusetts Board.

Examinations were conducted by the Massachusetts Board of Pharmacy September 12th, 13th and 25th, forty-eight applicants for registration being examined. Of these seven passed as pharmacists and twenty as assistants, being the following:

As pharmacists—F. J. Brannigan, of Ware; W. M. Heikinen, of Fitchburg; Frederick Lamb, of Cambridge; M. M. Leibel and B. E. MacIntyre, both of Boston; W. L. Merrill, of Newton; and A. W. Scott, of East Boston.

As assistants—J. P. Buyniski, of Worcester; Daniele Cangiano, of Boston; Alice J. Driver, of Lawrence; L. H. DuBois, of Lowell; J. W. Dunn, of Gloucester; A. N. Gakidis, of Manchester, N. H.; Giovanni Gallo, of New York, N. Y.; J. D. Glancy, of Upton; Eugene Guilbert, of New Bedford; J. J. Harrington, of Springfield; W. A. Jarrett, of Fiskdale; A. B. Lecain, of Boston; G. N. Lincoln, of Somerville; C. A. Lundquist, of Roxbury; E. L. McGrath, of Lynn; D. G. Piscopo, of Boston; J. L. Polley, of Cambridge; J. A. Remy, of Fall River; James Thomson, of Wakefield; and F. D. Williams, of Quincy.

The term of E. O. Engstrom, of Pittsfield, as a member of the board, expires shortly; under the law he cannot succeed himself and E. F. Fahey, of the same city, is talked of as a possible successor. The Massachusetts Pharmaceutical Association has nominated for the vacancy: Messrs. Dalton, Martin, and Ripley.

Michigan Board.

At the August meeting of the Michigan Board of Pharmacy the following persons passed the examination for registration.

As pharmacists—W. E. Ammerman, of Iron River; T. H. Bolitho, of Manistique; L. C. Crissman, of Rochester; A. B. Pohl, of Grand Rapids; N. S. Shapero, of Detroit; and P. J. Tobijanski, of Laurium.

As druggist—W. G. Martin, of Cheboygan.

The next meeting of the board will be held at Grand Rapids, November 21st to 24th.

New Jersey Board.

In September the board obtained judgment for \$100 against an Elizabeth drug-store employee who, not being a registered pharmacist, sold tincture of iodine.

New York Board.

At its recent annual meeting the New York Board of Pharmacy elected the following officers: President, B. M. Hyde, of Rochester; and vice-president, C. O. Bigelow, of this city. Warren L. Bradt, of Albany, is secretary to the board.

Oklahoma Board.

Out of a class of thirty-seven candidates for registration examined at the meeting of the Oklahoma Board of Pharmacy, held October 2d and 3d, at Oklahoma City, the following seventeen passed:

F. S. Beach, of Fort Cobb; E. P. Bellwood, of Wichita, Kan.; Vernon Bennett, of Oklahoma City; E. E. Breckenridge, of Carter; R. M. Connell, of Hugo; R. W. Ewers, of Tulsa; George Fugue, of Muskogee; S. B. Halley, of Oklahoma City; J. H. Houck, of Stillwater; Robert Keys, of Schoolton; C. W. Evans-Lombe, of Edna, Kans.; H. J. Oglesby, of Krebs; Q. Q. Quigg, of Galena, Kans.; Lloyd Ransopher, of Wichita, Kans.; E. H. Schellack, of Galena, Kans.; Z. G. Waters, of Lenapah; and M. A. Yeomans, of Oklahoma City.

The following graduates of schools of pharmacy recognized by the board were registered as pharmacists without examination:

L. E. Albert, of Dixonville, Pa.; J. F. Caldwell, of Washington, Pa.; Horace Crawford, of Alluwee; G. C. Faust, of Scalp Level, Pa.; R. M. Harper, of New Albany, Miss.; F. M. Moore, of Bennington; S. W. Porter, of Glen Ullin, N. D.; F. C. H. Roetting, of Oklahoma City; M. E. Rubin, of Parksville, N. Y.; W. D. Thorne, Jr., of Oklahoma City; Hoyt Weed, of Fairview; and J. P. Hefley, of Lawton.

The next meeting of the board will be held January 9th and 10th, at Oklahoma City.

Rhode Island Board.

Two applicants for registration were examined at the October meeting of the Rhode Island Board of Pharmacy. E. H. Mason, of Providence, passed.

The next meeting of the board will be held December 5th, at Providence.

Wisconsin Board.

Twenty-nine applicants for registration were examined by the Wisconsin Board of Pharmacy at the meeting held October 3d to 6th, at Madison. Twelve applicants were successful, being the following:

As pharmacists—J. A. Baker, of Randolph; and H. O. Jaasted and H. W. Leonard, both of Madison.

As assistants—W. E. Cleophas, of Beloit; Walter Fischer, of Milwaukee; J. W. Jensen, of Stevens Point; E. H. Koebler and Dale Ruedig, both of Milwaukee; Vivian Staples, of Washburn; A. L. Steen, of Madison; G. L. Stock, of Ottawa, Ill.; and Bernard von Engel, of Milwaukee.

H. W. Jones, of Mondovi, was registered without examination, being a licensee of the Minnesota board with which the Wisconsin board reciprocates.

The next meeting of the board will be held January 16th, at Madison.

Interstate Association of Boards.

The Interstate Association of Boards of Pharmacy, embracing the boards of Illinois, Indiana, Kentucky, Michigan, Minnesota, Ohio, and Wisconsin, met at Madison, Wis., October 3d, during a meeting of the Wisconsin board. The association elected the following officers: President, Burton Cassaday, of Indiana; vice-president, R. H. White, of Kentucky; and secretary, O. G. S. Boberg, of Wisconsin.

During the month of September the New Jersey board of health examined 9 samples of spirit of peppermint, 3 of which were above and 6 below the standard, and 14 of tincture of iodine, 7 of which were above and 7 below.

Obituaries.

GEORGE H. HITCHCOCK.

George H. Hitchcock, president of the New York branch of the American Pharmaceutical Association and its representative in the council, died suddenly at his home in this city, October 13th. He was in his fifty-seventh year, having been born at Homer, this State, July 23d, 1855.

In 1871, Mr. Hitchcock began an apprenticeship with Atwater & Kellogg, and following an inclination instilled by Mr. Atwater he became a registered pharmacist. In 1877, he went to Cleveland, Ohio, to conduct a prescription department for Mr. Kellogg, and a few years later in connection with his former employer he opened a laboratory in that city. In 1881, a branch was opened in the store of Fraser & Co., in this city, and later was transferred to 9 West Twenty-ninth street, the firm name becoming Kellogg & Co. After two other movings the business was located at 1031 Sixth avenue in 1896, where it remained until several months ago, when it was moved to the opposite corner. In 1906 the firm name became G. H. Hitchcock & Co., the present title.

GEORGE H. HITCHCOCK.

Mr. Hitchcock was very prominent in the pharmaceutical circles of the city. In addition to his activities in the local branch of the A. Ph. A. he was treasurer of the Manhattan Pharmaceutical Association and a trustee of the College of Pharmacy of the City of New York, and held membership in the several other local organizations as well as in the New York State Pharmaceutical Association, of which he had been a vice-president. His store was recognized as an example of professional pharmacy, and he was the moving spirit in the get-together meetings of the New York branch of the A. Ph. A. and the Medical Society of the County of New York.

Mr. Hitchcock was a Mason and a prominent member of the Royal Arcanum. His circle of friends is a wide one. He leaves a widow and one daughter, and is survived also by a brother who was associated with him in business.

MAX CRAMER.

Max Cramer, a trustee of the Massachusetts College of Pharmacy, died at his home in Roxbury, Mass., October 12th, at the age of sixty-one years. He was also a life member of the college and had been a vice-president and an auditor. Mr. Cramer was a native of Germany. He leaves a widow and three children.

The following are the recently reported deaths of other persons in the drug world:

GEORGE P. BAILEY, formerly of New Bedford, Mass., at Natick, October 2d, aged fifty-three years.

JOEL J. BARNETT, of Baltimore, Md., October 4th.

J. C. BEECHLER, of Oskaloosa, Iowa, October 16th.

HENRY BLUMNER, of Baltimore, Md., October 13th, aged thirty-five years.

IGNATZ DEISSIG, retired, of Brooklyn, N. Y., October 12th, aged fifty-one years.

WILLIAM FRAMTON ELMENDORF, of Albany, N. Y., September 19th, aged eighty-two years.

T. N. HARROD, of Bellecenter, Ohio, October 8th.

FRANK W. HAYWARD, of Sussex, N. J., September 24th, aged thirty-seven years.

HERMAN KOEGEL, of Owensboro, Ky., at Cincinnati, Ohio, September 26th, aged forty-four years.

CHARLES R. LOWELL, of Greenfield, Mass., September 24th.

JOHN A. McGRATH, of Keokuk, Iowa, at St. Louis, Mo., October 5th, aged fifty-six years.

HENRY H. MESCHENDORF, of Louisville, Ky., October 8th, aged twenty-nine years.

B. E. OLIVER, of Auburn, Wash., September 27th.

AUGUSTUS E. PRICE, of Gloucester, Mass., September 28th, aged eighty-three years.

ROBERT C. SPOHN, of Toledo, Ohio, September 26th.

CONSTANTINE TROXLER, of Louisville, Ky., September 30th, aged fifty-four years.

MURRAY R. WILSON, formerly of Providence, R. I., at Brockton, Mass., October 8th.

GEORGE YOUNG, of Denver, Colo., October 12th.

GEORGE ZELHOFER, of Brooklyn, N. Y., October 14th, aged fifty-nine years.

Alfred Lee Manniere, Esq., of this city, died October 1st, at the age of fifty years. He took a prominent part in anti-narcotic affairs, and was forward in the recent efforts to amend the pharmacy law of this State.

An Antiseptic Millennium.*

BY JAMES RAVENSCROFT.

When grocer, and butcher, and baker, mind health laws as laid down in a book,
When the cooks who rule in our kitchens wear sterilized gloves when they cook;
When butler, waiter and waitress shall be antiseptically fit,
When at antisepticized tables we shall antiseptically sit,
And eat only pasteurized victuals with sterilized spoons, forks and knives,
And only from pasteurized bottles the babies shall nourish their lives;
When we shall sleep only in bedrooms from bacteria made immune,
And take baths in boiled water only (and be taking more of them soon);
When taxicab seats shall be harmless, and even the street cars be clean,
When Pullman car berths shall be spotless (and porters don't have to be "seen");
When all coined money is polished, and the bills are laundered and dried,
When the first microbe is forgotten and the last one discovered has died;
When handshakes shall be sanitary, and kissing shall be made a crime,
When the air before we breathe it shall be "treated" and stored for a time,
Then those that survive shall be perfect, and glad they got in the game,
And scientists only shall praise us, and scientists only shall blame,
We shall rest, and you bet we'll want to—let up for a whole month or two,
Till the scientists all get together and start us out on something new.

Atlanta dedicated a peace monument October 9th, with appropriate ceremonies conducted by the "Old Guard" of the Gate City Guards. Elaborate engraved invitations were sent out, bearing the names of Hoke Smith, governor of Georgia; Courtland S. Winn, mayor of Atlanta; and other dignitaries, as well as members of several committees. The name of Joseph Jacobs appeared among those of the citizens' committee, while F. L. Seely was among the representatives of the Chamber of Commerce.

"A vote by the inmates of our jails and penitentiaries would show an overwhelming majority in favor of the abolition of our police," is the comment of one pure food advocate in referring to the recent attacks made on Dr. Wiley. This leads the *National Bottlers' Gazette* to remark that a canvass of the adulterators and their supporters would show that they all glory and shout because of the mud that is being thrown at Dr. Wiley and are hoping that he will be ousted.

The Michigan Association of Retail Druggists at a meeting held last month at Flint, adopted resolutions supporting Dr. Wiley and his associates in their position on the enforcement of the pure food laws, and President Taft for his endorsement of Dr. Wiley's attitude. The association pledged its co-operation with Dr. Wiley in a continuance of his efforts to have pure food and drugs.

* From the Journal of the Southern States.

DRUG STORE MERCHANDISING

Selling Candy.

There Is in Confectionery a Large Profit, both as to Bulk and Percentage—A Few Words about Package Goods for Druggists and a Timely Suggestion.

In the majority of drug stores in the land, it is fairly safe to assert, confectionery is a line which is either shamefully neglected or frightfully abused. And doubtless it is equally safe to say that in that minority of drug stores in which candy is handled in a business-like way, it pays as satisfactory a profit—investment, space and time considered—as any other side line.

Wherever there is a soda fountain, customers naturally expect to find candy; and where there is no fountain, there is all the more room for a confectionery case, and more necessity for having something to attract a certain class of very desirable trade.

Of late years there has sprung up a great rivalry among manufacturers of high-grade box confectionery, and their efforts to surpass each other have stimulated the demand for sweetmeats until now the figure representing the annual expenditure for candy, could it be ascertained, would probably be astounding. The people have more money to spend for luxuries now than they have ever had before, and perhaps the first luxury that a majority of them think about, is candy: the little tot of the squalid tenement, squeezing in his grimy hand the penny which has come to him by hook or crook, in his quest of an all-day sucker, is no more earnest than is milady when she orders a 5-pound box of her favorite chocolates to take with her as she goes motoring. High and low, rich and poor, men and women, all America meet on a common footing of candy-eating.

Box goods are for many reasons the kind of candy best adapted to drug-store trade. In the first place, they pay a good profit—and then they are not "mussy," require no "pawing over" or weighing, are not subject to the loss which comes from "sampling" or giving down weight, and they retain their freshness longer than the goods displayed in open trays.

For more years than most of us remember, "a box of Huyler's" has meant a box of fine candy, so when the CIRCULAR began to look around to see something definite it could do to help druggists get a larger share of the millions of dollars that represent candy profits in this country, it naturally consulted "Huyler's." "When we estab-

lish a sales agency with a druggist," said F. De Klyn Huyler, president of the company, "we do not require that he purchase any stipulated quantity of goods." Then he went on to say: "The druggist, of course, realizes that it is to his interest to have an attractive display, and when he becomes acquainted with the demands of his trade will know in what quantities to order to insure a fresh stock on hand at all times.

"We supply to our agents a very attractive dummy display, for which we, of course, make no charge, and in addition, supply them with attractive signs, etc.

"As to the size of packages, we recommend, that, of course, depends upon the size and wealth of the town, and the general demands of the druggist's trade. The margin of profit also varies on the different packages, but that the margin of profit is a good one is proven by the fact that we have on our ledger the names of thousands of druggists, some of whom have been handling our goods since the organization of our firm."

One of the companies manufacturing a high grade of box confectionery which has been making a strong bid of late years for the druggists' trade, is the Belle Mead concern. Mr. Rockhill, secretary of this company, seemed by no means averse to giving some reasons why druggists should handle a well-recognized line of fine box candies, and incidentally has spoken of some of the methods which have helped his house succeed. "As you already know," he began, "we make candy 'pure'; that is, we never allow glucose or anything except sugar, fruit, nuts, etc., to go into our creams—we do not allow coloring matter or anything of that kind." Mr. Rockhill more than intimated that the practice of his house with respect to deleterious materials was not universal among candy makers. Then he turned his attention to the matter of sealed packages, saying: "We believe that no candy should be allowed on the market except in sealed packages, for, in our opinion, even in the best regulated stores, candy comes into more or less contact with dust, germs, etc., brought into the place by the people coming in throughout the day; therefore we insist that every ounce of our candy be packed in our own factory and sealed." He was unable to call to mind another candy manufacturer which enforced such a rule.

Mr. Rockhill asserted that a druggist is not wise to carry more than one line of candy, and while he admitted that to be a rather broad statement, he said he had seen numerous instances which tended to sustain its truth. Some reasons for this view he stated as follows:

"To-day the people of America are gradually finding out that candy has been one of the worst-treated articles, b"

the manufacturer, ever made, and they are commencing to insist on knowing just how their candy is made.

"The people of America look to the druggist to have the one store they can trust to carry pure and good merchandise, and therefore the druggist should spend a little thought and time in finding out what, in his judgment, is the best and then putting it in his store and pushing it. He will gradually find that his customers realize what he is doing, and not only give him their candy business, but come to him for everything else, for while a purchaser usually goes to the nearest drug store for a tooth brush, or medicine, when the druggist secures the exclusive agency for a candy, it means that the people of his neighborhood have got to come to him for that candy, whether he is their regular druggist or not. Every time he makes a customer for the special brand of candy which he carries he gets one more person in the habit of coming to him, which has a tendency to prevent the customer from going to his competitor for other things. We all know that habit in a purchaser is a mighty wonderful thing.

"Right there is one of the biggest thoughts of all, and one of the best reasons for selecting the one candy which he knows is the kind he ought to sell his customers and then stick to that one line. There is no customer whom he can not win to his candy if he has the recognized fine line, although at the start he may have a few customers who insist on something else, but he will gradually win them, and when he has made a candy customer he has made a customer for other things he carries, whereas with a product in his store like tooth brushes, which his competitor can sell, he simply draws the trade of his neighborhood when he happens to be the nearest druggist to them.

"Again, the time has come when every product in the drug store, or any store, as to that, should be sold with a little bit more attention to whether it is the best that can be secured for the money. If a brand of candy is made right, packed right, shipped when fresh; if the manufacturer treats his agents right and sells them candies at a price that enables them to reap a profit, then what excuse is there for a druggist to buy candy that is not just what it should be, and why should a druggist expect to win customers from his competitor if he does not have a candy that is in some way better than the usual standard makes?

"We do not think the druggists of America have yet realized the importance of candy, for candy not only brings a profit of its own, but from our experience we believe it is a business-getter with any druggist who has the right line; and, further, that he will let his customers get in the habit of going somewhere else if he happens to sell the wrong line."

There is too much in the candy subject for presentation in one number of the CIRCULAR—it would be almost as easy to present the subject of pharmacy or of soda water in one issue and stop—so there will be much more said on it in this department from time to time. Just now, though, is the time to emphasize the fact that with the approach of cold weather the candy business will begin to look up; and that by Christmas it will be at its height. The wise man will be ready to meet the demand.

Sign writing is not hard to learn, and neat signs hanging about in the store or in the show window are a trade stimulant of no mean proportion. One thing which may be said in their favor is that they work all the time, even when the store is closed and the clerks are asleep. In every store where there are as many as three or four people, perhaps at least one has a latent ability to do artistic card lettering, and needs only a little encouragement and practice to develop this talent.

"Be sure you are right, and then go ahead" maybe good advice, and anyone can give it, but the emptiness of it, the emptiness of it! How is one to know he is right, in many cases, until he has gone ahead? The man who never goes ahead when he may be wrong may be a model as a piece of statuary, but he could not qualify as an "also ran" in a lame man's race.

Now is a good time for the druggist to look over his stock of rubber goods. Hot water bottles will soon be in demand, and portions of last winter's assortment may have to go on the bargain counter as damaged goods. The sooner the old stuff is cleaned out, the less loss there will be on account of its deterioration.

Making Goods Yield a Profit.

It is not necessary for a druggist who wants better prices for his goods to wait until some association "resolves" that he should have them. Indeed the "resolution" route seems to have no end—to lead to no definite plan. How one druggist, single-handed, "boosted" prices is thus related in the *Red Cross Messenger*:

He went over his stock and scheduled all his goods which were being sold at prices too low to offer a living profit. These he classified into groups, "patent" medicines, drugs and chemicals, specialties, sick-room appliances, household remedies, rubber goods, various plasters, surgical dressings, etc. Opposite each item he placed the new price—one which was a reasonable raise.

He was astonished to find that certain goods had been sold for some time at less than cost. He found others had been sold at low prices without any regard for demand, probably from force of habit or else by reason of an epidemic of cutting in his vicinity.

He found that there were many goods on which the price could be advanced without encountering opposition. Among these goods were certain items which had a moderate sale, which were used for particular purposes by people who would not haggle about the price. These he advanced at once, then week by week, sometimes daily, he went over his list and systematically raised the prices. He went about the work cautiously, instructing his clerks to give particular attention to any opposition on the part of buyers and when such opposition occurred to attempt to meet it with arguments as to quality, higher cost, good service and the increased cost of raw material, living and doing business. In some instances the customers were frankly told that the goods had previously been sold at less than cost, thus being taken into his confidence.

He also talked the matter over with a few of his friendly competitors and immediately two of them followed his example, using his list.

To his surprise he found the loss of sales were very few. He forestalled opposition by using his newspaper space, and other advertising adjuncts. He interested his trade by talking about quality, high service, accommodations, experience, and by hinting in an unobtrusive way that low-priced drugs and medicines were dangerous—that every drug he sold was guaranteed under the pure food and drugs law. In fact, he found himself gaining new trade; customers came simply because he had the reputation of having everything of the highest grade.

Now this druggist firmly believes that it is a good thing to acquire a reputation for high prices.

The whole scheme was carried out systematically, carefully, and gradually. In less than a year the figures showed that he had been able to make an advance of from 10 to 50 per cent. on each line of goods.

The movement gradually spread among his competitors. While here and there some fellow would find out that he had raised his prices and make a noise by advertising something at a cut rate, this kind of disturbance soon blew over. He says that he is convinced that with good salesmanship, good goods, and good business policy a druggist need not be afraid of anyone.

Better price movements are reaching out into all lines of retail work. Hardware stores, grocery stores, dry goods stores, and even department stores are tending that way. While many still offer bargains to attract the trade, more and more they keep an eye on the profits and will eliminate the general wholesale slaughter so long in use.

Men Wanted: Salary No Object.

"Capital is easy to get, but men are not." Any man or syndicate of men, personally honest and known to be industrious and progressive, can present a good business-producing idea to the money lenders and get all the financial backing needed. But when it comes to the matter of getting men to work for them—men of ability, industry, integrity, loyalty—they encounter an obstacle which causes many a brilliantly conceived plan to lose the name of action.

"God give us men," sang the poet; and the refrain is heard in practically every business establishment in the land, from the small drug store which furnishes employment for one clerk, to the largest chain of stores, manufacturing and wholesale establishments, and billion-dollar trusts.

Standing in with the Bank.

Much has been said of late about the financial benefit to be derived by druggists from utilizing the means supplied by bankers for promoting their business. Articles on borrowing money and discounting bills, and reports of discussions of the subject may be seen in the issues of the CIRCULAR for last month, page 613, and for the month before, pages 507 and 542. Here is a short note bearing on the subject, from *Business*:

"It takes the average merchant years of experience to get him to grasp a principle that he should take home to himself the first time he pays for a bill of goods," says a retailer who has built up his business mainly through his financial ability. "I refer to the principle that the place to borrow money is at a bank or other financial institution and not of the jobber or manufacturer who supplies the goods.

"I got my bank accustomed to 'taking the cash discount' by going to the president, when I first began business, and saying, giving him a copy of the order, 'I am going to buy these goods from my jobber. Their discount is so-and-so for spot cash. If you are in a position to take advantage of this rate of interest, supply me with the money and take the discount yourself, and I will pay you in sixty or ninety days.'

"Commonly the banker would be glad to do it, and I not only got an inside price, but got two more valuable things, a reputation with my suppliers for paying cash, and I built up my credit with my banker so that I was able to get money from him when other business men in the same town were offering high rates for ready cash and were unable to get the accommodation.

"It can be set down as an absolute surety that your banker can afford to lend you money on better terms than your supplier—for that is what the latter does when he extends you credit. The dealer who discounts his bills takes a first, clean profit that appeals to the imagination—and starts the money-making early in the game."

What Is a Grouch?*

A grouch is a peculiar variety of an individual who hates himself, toils not for his master and spins but tales of woe.

He works himself into a frenzy over nothing and wastes his talents on the sea of prejudice.

He froths, fumes, barks, growls, and bites himself.

He has everything condemned and the universe on the toboggan.

He puts the kibosh on the good intentions of others and lets his own present slip into a very slimy past.

His disease, is contagious and those who catch it find the only antidote is in knocking somebody's head off.

Supreme conceit lies within the grouch.

And his principal effort in life is to make himself unnecessary to others.

He rates cheerfulness as nonsense and a smile as insincerity.

In fact, he is all out of focus, short circuited, punctured, and his fan strap is slipped.

If I could think of other things I would write them

But I can't.

So shoosh.

The modern business man is constantly seeking new contributions that he may make to society out of which will be paid him a profit as his reward. Such new ideas only come to the man whose brain is prepared, like the soil of the farmer, for the seed that falls. Broaden your vision by studying things that do not concern you immediately. To-morrow something in Japan or in Australia may affect your business. If you have read up about Japan or Australia you will understand the meaning of the fact.—*Bulletin of the National Association of Credit Men*.

Promptness and courtesy in waiting on customers is of quite as much importance as giving them the desired article at the right price. The attitude of many clerks and some proprietors would seem to indicate that they are considerably annoyed at being disturbed by the entrance of a customer and this impression on a customer does not irresistibly draw him back for the next purchase.—*Pacific Drug Review*.

* From Tips.

West Now Wants Cents.*

After years of turning up noses at cheap people of the East who would need such a small coin as a "penny" in doing their daily business, there has been developed a real call in the West for these same coins. It is largely due to the feeling of the housewives that much money could be saved in their buying at the shops and in other ways if they had the small pieces of money. A movement has been put under way for the banks to import the coins, and some of the shops are already advertising wares for sums that change into "pennies," and are handing out those coins.

When an inquiry was recently made into this subject by persons interested it was found that less than 20,000 pennies were in the city. Many of them were held in banks, which said they had difficulty in disposing of them. As in other cities in the West, the "nickel" had been the small coin, and the easy spenders had treated even that somewhat contemptuously. The newspapers sell for five cents a copy. Children have been brought up to the idea of asking for a nickel for candy and spending it.

Now the cost of living is coming home even to the free-spending West, and housewives have found that it is not only well to look after the "nickels," but the "pennies," too. It is pointed out that under the present system if a purchase comes to an odd amount the total is put up to make the even "nickel" for the shopkeeper. For instance, eggs, now 23 and 33 cents a dozen in other places are 35 here. It is also said that the satisfaction of childish wants with small coins would bring a good saving.

W. W. Armstrong, president of the National Copper Bank, is one of those who has looked into the situation. Speaking of it, he said that the bankers of the city had never been called upon to handle "coppers" in large amounts, and would not bother with them unless customers asked for them.

"Salt Lake has few 'pennies' in circulation," he explained. "It costs so much to ship them here that they are not in a hurry to get them into circulation. Yet dealers, bankers and retailers admit that if about 2,000,000 'pennies' could be scattered through the cash registers in the small stores, there would be an appreciable decline in the cost of living, for the poorer families, at any rate."

A Hard Master.

Habit is a bad master. Many men do a thing or refrain from doing it simply through force of habit without being able to give any reason for their action. Maybe there are some druggists among these men; indeed it has been intimated in some quarters that the average of such men in the drug business is high.

Some druggists buy a certain preparation which they could make to advantage, simply because they have always done so; others make a preparation when it would pay them in time, money and satisfaction to buy it ready made. And it is the same way with extending or refusing credit; carrying or refusing to carry certain lines; going after the prescription business and bringing it to their stores or letting it get beyond their reach.

Certain druggists have found that it pays them to borrow money at ½ of 1 per cent. a month and discount bills which carry interest amounting to 2 or 3 per cent. a month, while others, from force of habit, go ahead paying the higher rate. Many druggists have discovered that it pays to get out of the rut in the matter of advertising, in the matter of fixtures, in the matter of various kinds of things connected with their methods of doing business or the appearance of their stores.

A habit, like the little girl with the little curl, when good is very, very good, but when it keeps a man in a rut it is horrid.

Thanksgiving Day Tip.

Thanksgiving Day affords an opportunity for the live dealer to reap a harvest. Pepper, sage, spices, flavoring extracts, etc., are strictly drug merchandise. Now is the time to display them, to advertise them, to "sample" them, and to push them in every possible legitimate manner. There is good profit in their sale.

The people are alive to the value of pure goods and already are inclined to believe that the drug store is a better place to get them than the grocery.

* A press dispatch from Salt Lake City.

On Holding Trade.

"Quick Sales and Small Profits" as Good Business for Druggists as for Other Merchants—One Sale at a Large Profit Is Poor Business; Many Sales at Small Profits, Good.

By M. P. GOULD.

There are certain kinds of goods for which there is a fairly fixed demand, which can not be stimulated to any great extent. On the other hand, in connection with the great majority of products there is a direct relation between supply and demand—between price and profits. For example: if the price of meat gets too high, a great many families will eat a cheaper kind of meat or eat meat every other day, instead of every day. The same thing is true of nearly all the commodities of life. In New York city some time ago, there was a law passed which reduced the price of gas from \$1 to 80 cents per 1000 cubic feet. As a result, the price of stocks in the gas company fell off to a considerable extent. But with gas at 80 cents per 1000 cubic feet instead of \$1, so many more people began to use gas, both for light and heat, that the company's profits increased instead of decreasing.

The same thing has been proved with regard to the price of daily newspapers. Many publishers used to contend that a good paper could not be distributed profitably for less than two cents or three cents a copy. Then some daring publisher, probably in desperation, trying to increase his circulation, cut the price to one cent. His circulation increased so fast that now a great number of daily papers throughout the United States are sold at one cent a copy; and there never was a time when the publishers made so much money as they do now.

And so it is with regard to a thousand other things. There are many goods now sold in drug stores at too high a price. If they were sold at a lower price, the druggist would make a larger profit. For example: denatured alcohol is sold in many drug stores at 25 cents a pint, 40 cents a quart, and, as a special concession to favored customers, sometimes at \$1 a gallon. Now, denatured alcohol can be purchased by the druggist and sold at 60 cents a gallon, in 1-gallon containers, and 50 cents a gallon in 5-gallon containers—and yield a good profit. It can be sold at almost the same ratio in quarts, pints and half-pints, and still return a full profit.

Some druggists feel that if they sell denatured alcohol at that price they are merely cutting their own price for wood alcohol and denatured alcohol, and will therefore simply injure their own business and reduce their own

profits. They argue that only just so much denatured alcohol will be used anyway; therefore "every time we sell a gallon for 60 cents instead of a pint for 25 cents, we cut off that 'big' profit that would come to us anyway if we would let people buy it in small quantities and pay for it at a big price, proportionately."

That argument is a pure and simple fallacy. Now-a-days there are so many alcohol-burning percolator coffee pots in use, and so many alcohol-burning chafing dishes, heating stoves, marine stoves, household stoves, house lamps, automatic-heating flatirons and other devices for the consumption of denatured alcohol that there is a growing demand for this fuel. Consequently while the druggist takes the narrow view of keeping the price up, the customer or consumer either does not buy the percolator which burns that fuel, because the fuel costs so much, or goes to somebody else who sells the denatured alcohol at a lower figure.

In one big city a dealer thought that he would see what he could do by making a run on denatured alcohol at the 60 cent and 50 cent a gallon price. In a short time, strange as it may seem, this dealer was selling 25 barrels of denatured alcohol a week. His profit was 50 per cent. or 20 cents a gallon, or a total of something over \$200 a week. His demand is increasing all the time. Other dealers at first thought that he would "kill the trade." Then

You become quite expert after doing a thing for 40 years.

That quite necessarily applies whether one is a student or a scientist, a mechanic or an artist, a worker or a thinker. And it applies above all to the selecting and compounding of medicines.

So many years' experience in the putting up of prescriptions is proof enough of ability and care.

Add to experience, ample facilities, modern equipment—that makes for accuracy—and a stock of the finest drugs, and you can readily see many reasons for bringing your prescriptions to us to be filled.

If you recognize our especial ability in this work you will quickly add yourself to our list of satisfied customers.

(Name and Address)

they suddenly discovered that their trade was not being affected, but that this man was building up a big business of his own. How big a business can be made will be understood when you realize that in Germany 38 million gallons of denatured alcohol were sold last year, while in the United States with more than twice the population of Germany, only 12 million gallons were sold. The people of the United States are always extravagant. If the careful Germans burn, roughly speaking, one gallon per capita a year, the people of the United States should burn about three gallons per capita a year. That would mean that there should be consumed in this country something over 250 million gallons a year, at a profit of 20 cents on each gallon to the dealer. That is a clean profit of 50 million dollars a year for the dealers, whereas the 12 million gallons now sold, even if they yield a profit of 40 cents a gallon, bring the retail dealers only \$4,800,000 profit annually. In other words, the dealer, because he is afraid he will lose his high profit on a little 25 cent sale, robs himself of ten times as much total profit.

This rule of supply and demand applies more aptly to a thing like denatured alcohol, than it does to potatoes or onions, or meat. People think that they must have potatoes and onions and meat. They feel they cannot live without these articles of every day food. However, they do not have to have denatured alcohol. For light and heat they can burn kerosene or gas or coal or wood or coke or acetylene or crude oil, consequently the sale of articles in the "semi-luxury" class with denatured alcohol must be increased by "wooing" instead of "forcing." In order to secure the maximum of profit, the public must be induced to try these wares and learn their real advantages. One may not sit back and say, "Pay this price or go without," because people *can* go without.

On the other hand, denatured alcohol is an article which naturally should be sold in drug stores. The druggist does not want to handle kerosene, because it is smelly and mussy. He is not in the coal and wood business. He cannot handle gas. But denatured alcohol is a thing which many now do handle, and which more can handle and in much larger volume. People are in the habit of coming to the druggist for alcohol. The drug store is the first place they think of when they want any sort of alcohol.

There are many other things in drug stores which are more luxuries than necessities. The sale of such goods depends on the fancy of the consumer. He buys them if at all, of his own free will. He cannot be driven to buy them. He must be shown the reason, the advantages to himself, for buying them. As an instance: Many druggists were very much perturbed when quinine tablets were first offered to the public in bottles, containing 100 tablets. Some druggists felt that offering 100 tablets for 25 cents or 30 cents was such a tremendous reduction from 10 cents a dozen—which price they were accustomed to get—that their business in that line would all go to "pot." It did not. The new departure simply increased the call for those goods, consequently nowadays, when a druggist charges 10 cents a dozen for quinine tablets, the customer *may* pay the price and say nothing, but the next time he is quite liable to go to some other store.

Olive oil is an article of which there should be ten or twenty times as much sold by druggists as there is now. If it were sold in a more liberal way people would get in the habit of drinking it. They would use it far more freely on salads and in all kinds of dressings. They

Drink Olive Oil

Yes; *drink* it. It is a food-beverage, much to be preferred to coffee, tea or even cocoa. : : :

Pure Olive Oil has a palatable, nutty flavor; even the children like it—and they may have it. : : :

Good for all sorts of salads, and for cooking, too. : : :

(Name and Address)

would give it to the children. There would arise dozens of other ways so that where a druggist now sells one gallon he would sell ten to one hundred gallons.

Castile soap is an article the sale of which some druggists have retarded or killed by old methods. They did not handle it in the right way, and their trade buys castile soap somewhere else, or does not use it. Those who merchandise castile soap in the right way have learned to know that when people can buy castile soap in large quantities at a low price, they use it up so much faster, by wasting it, or using it profusely that they consume ten times as much as under old conditions.

Paraffin is another article which is now sold in quantities of 50 pounds frequently where formerly a pound or two was disposed of. It will be sold in still greater quantities if properly handled. Such things as glauher salt, the druggist often sells to his own injury. A farmer or horse owner goes to a grocery store or a general store and buys 5 pounds of glauher salt for 25 cents. With that quantity on hand, he uses it rather lavishly and soon comes back for more. At 5 pounds for 25 cents the grocer makes a profit of 10 cents. Instead of that, many druggists do not want to sell such goods at such a close

profit, so they sell 1 pound for 10 cents and make about 7 or 8 cents profit. To them that looks very attractive. The "rub" is that as soon as the farmer "gets wise" he goes to the grocery store and buys it at 5 pounds for 25 cents. The druggist makes a profit of 8 cents once, whereas he might make a profit of 10 cents repeatedly. No great business was ever built up on one-time orders. Unless a product or a business can count on continual repeat orders, it will always be small. The only kinds of goods worth advertising are those which, after the advertising has introduced them, will continue to sell themselves. Unless a concern can hold its old customers after it had once got them into the store can never grow to be a great business. This is a well-known axiom among successful manufacturers and retailers.

Perfumes are another line of goods that the druggist does not usually sell at as close a profit as the department store. The result is that many perfumers now say that they can disregard the drug store trade of the country—that 80 per cent. of their perfume is sold to the department store. What a sad commentary on the "penny wise and pound foolish" method of doing business! If a druggist pays 20 cents for an ounce of perfume and sells it for \$1, making 80 cents profit, he is happy, is he not? Well, he should not be, because he is killing the goose that lays the golden egg. There are many business men in the world who will sell that same perfume at 50 cents or 39 cents or 29 cents and be happy and prosperous with a 30-cent or 19-cent or 9-cent clean profit. The man who makes 80 cents profit on a 20-cent ounce of perfume, makes it only once or twice—and he makes it on the "sucker" trade.

Sucker trade is a very sandy foundation on which to build a business. A sucker is a man who buys ignorantly. New suckers may be born every minute, as the old saying has it, but how many people want to build a business on getting customers and then losing them.

Druggists carry certain articles to which manufacturers have given fancy names and try to sell at four or five times their legitimate price. Retailers have seen the trade go up and then go down, because the public found out that the standard line, sold at one-half or one-fourth the price of the trade-marked article, was good enough

for them. Any one who travels around the country will see that certain druggists have learned the merchandising lesson. They have learned that certain goods show an increased profit to them, when the individual profit on each sale has been reduced by half or more.

When twenty-nine cent candy was brought out, did it decrease the profits on candy to druggists? Certainly not! It got many more people to eat candy. After they had acquired a taste for candy they then demanded better candy. The selling of 29-cent candy has actually and greatly increased the demand for 80-cent candy. The people who put 29-cent candy on the market did not expect that offering candy at 29 cents would increase the demand for 60-cent and 80-cent candy. Nevertheless, they themselves are now manufacturing and selling vast quantities of 60-cent, 80-cent and \$1 candies.

The publisher of one of the biggest newspapers in America was asked to explain how an ideal advertising rate card in a newspaper should be made. His reply was: "I suppose that making a rate card for advertising space is just like everything else. You charge what the traffic will bear." Then he went on to explain that what the traffic would bear depended on competition and the natural law of supply and demand. "For example," said he, "if you can ship grain from Galveston to New York by boat for one-half the price that you can by steam railroad, then either the railroad must content itself with carrying only the fast freight, or it must reduce its price on grain until its quickness will offset the lower price of the boat, or else it must own a monopoly of transportation including both waterway and railway transportation." The result, he stated, was that the railroad charged all that the traffic would bear. That is, it charges the highest price that it can without losing traffic.

The same rule holds good with every product on the market. The druggist has two distinct elements to contend with. He has first of all the price that his competitors will charge (and he must not forget that his competitors are not only the other druggists of his town, but the local grocers and hardware dealers and department stores, and paint dealers, as well as the mail-order houses in other towns). In the second place, he has to contend with the consumer's own notion as to whether he (the consumer) will buy at the price which the dealer has asked. These elements are so intertwined and related and dependant upon each other that they both must be taken into consideration.

Druggists in a town can not get together and say, "We will charge \$1 per gallon for denatured alcohol."

For, along come the grocery store and the hardware store and the department store and the general store, saying: "Denatured alcohol can be bought for 40 cents a gallon. We sell it for 60 cents and make 50 per cent. profit. That is more than we make on many lines of goods. The druggists are asleep. We will take that trade away from them before they wake up." The result is that while druggists are all "standing beautifully together" in such a matter some other line of trade comes along and takes the business.

All the foregoing has so much to do with successfully advertising a drug store that it is commended to the attention of wide-awake druggists. The store which is growing is the store which is *not* driving its customers to other stores. It is the store which is holding the chance customer, the passing customer, the transient, the woman who responds to some special advertisement, and the woman who is told by a friend to come. It is taking advantage of these opportunities, of so pleasing the chance customer by price and service that she becomes a permanent patron of the store.

Not long ago a big manufacturer got his directors to-

(Name and Address)

gether and persuaded them to appropriate \$100,000 for advertising. Then the manager, in order to make sure that that \$100,000 would be spent wisely, wrote to a number of large advertisers, asking them certain questions. One question was this: "Have you found advertising to be a distinct money earning factor in your business? If so, what kind of advertising has been most productive?" Here is the answer which one very wise advertiser made: "Yes. The kind that brings re-orders. It is the re-orders that pay the expense."

There are in the advertising pages of THE DRUGGISTS CIRCULAR hundreds of suggestions on timely topics, fresh from headquarters, each one radiating life, each full of a contagious vigor. The druggist who can read these and not thereby be made a better business man is a hopeless case.

Speaking about ruts, habit, and such things, maybe a new style of label would help some drug stores. At any rate, it does not hurt to think about it. A unique label, a uniform style for everything that goes out of the store labeled, has a special value as a sort of trade-mark.

The drug business of the H. V. Chamberlain Company, of Alton, Mo., has been sold to S. D. Hallam, who will remove the stock to Madison. Harry Chamberlain, who was proprietor of the drug store, has been in the drug business for the last fifty years in Alton.

It is the sale *almost* made—the lost sale—that gives the retailer most cause for worryment, as he watches an angry customer, or even a disappointed one, go out.—Robert Frothingham, in the *Delineator*.

The two stores of the Charles Clarke & Son Co., at Lawrence, Mass. have been sold to Louis K. Liggett Co.

The Stroller.

This Free-Lance of Drug Journalism Becomes a Harun-al-Raschid of the Soda Business and Sets Down in Much Grief Many Things He Saw, Much of Which He Was.

Come hither little one and list to the story of my life. While it is sad in spots it is not so very long, so open your eyes and close your ears and it will all soon be over. When I was a lad I served a term as soda server for a small drug firm—but this is a prose story and I must not poach upon the preserves of me ole fren and fellow author Gilbert. Anyhow, I drew the soda, and I drew the trade from beyond the stores of our competitors. "Tell us the secret of your better-than-the-others' soda," said our customers.

The Secret of Good Soda.—

"There is no secret to it," I replied. "I simply use good ingredients, fresh and clean, and am liberal with them. That's all." Of course it wasn't all, for I was quick and careful and attentive and kept the fountain and the counter looking neat, and all that, but of course I was too modest, *then*, to call attention to these things.

That was a long time ago, but I have not yet forgot or forgotten—whichever is the right word—what good soda and good service is, even if I could not now get behind one of these modern "iceless" fountains with back bars and front syrup jars and hold my own with the nifty boys who pump and squirt, hump and flirt all day long and well into the night. 'Twas the old-time dog-house pattern for mine until the innovation in the shape of a well apparatus came along.

But I promised the story of my life would not be long, so let's hurry and away.

If the Public Were Only Hep, My!—

If everybody knew as well as I do what good service and good soda are, and was as intolerant of the other kind, 90 per cent. of the soda fountains that I am acquainted with would have to go out of business. And if I were the boss of the remaining 10 per cent., 90 per cent. of them would have to mend their ways in several particulars.

A Natural Question.—

Why, oh, why is it that although the secret of success in the soda business has been proclaimed as if from the housetops for years and years, many soda dispensers have not learned it, or, if they have, make such small use of their knowledge?

A Grieved Lover.—

I am still a lover of the delectable confections whose habitat is on, under or behind the marble counter, so I frequently drop into a drug store for the double purpose of gratifying my palate and observing the service. By "service" here is meant everything connected with the making of the drink—the fountain, the attendant, the glasses, counter, silyer, straws, chairs (or lack of them), and, of course, the quality of the drink itself. Only now and then am I impressed favorably, whether the service under observation is on Broadway or at Cobb's Corners.

Experience Number One.—

In a Broadway store I asked for a malted milk. The attendant was a courteous young man who inquired if an egg were wanted in it. I said I would have an egg. The drink was quickly prepared and was all that could be asked for. I began to nibble at a cracker which was in easy reach, and the attendant asked if I would try a sandwich, at the same time suggesting in a pleasant way that it would be found very good. Again I agreed to be the goat to this extent. The check amounted to 25 cents and the transaction was agreeable all 'round—except that the attendant had very long finger nails under which had accumulated a most noticeable quantity of very dark ma-

terial. Horrors! And suppose I had been a real lady. More horrors and more of the other things—!!! (Yes, Mr. Printer, that's what I wanted. Thank you.)

Disappearing Done While You Wait.—

Tell me, Mabel, didst ever see a brood of chickens with the old hen out in the grass one minute, and the next minute, after the hen had given the warning cry that something which might be a hawk was flying around, look in vain to find a trace of a chick? Well, that is the way with some soda clerks I have tried to meet—and I'm no hawk and they are no chickens, but on the other hand I am one who brings into their place of business that where-with their salaries are paid. Isn't it funny, Mabel? I have enjoyed (?) this experience many times, and the clerks did not know me, either; did not know that I was a scribe taking notes to print. Here is a case in point:

One Man Who "Came Back."—

Being so well pleased with the malted milk found in Broadway, I, the Stroller, a modern Harun-al-Raschid of the soda fountain going about in the trade unknown to those upon whom he called, dropped into a bright-looking store in a select neighborhood. There was no one in sight except a negro porter, and he was beating it rapidly, as if trying to beat the band, when I hailed him to come back. He came back, although the sporting editor informs me that this is most unusual. I asked him if a glass of soda could be purchased in that place. The porter reckoned so, and proceeded to mix up the concoction in a way which showed that he had been permitted to 'tend the fountain before. The drink was—well, it certainly suffered in comparison with the Broadway beverage, although if there was any dark-colored material under the porter's finger nails other than what nature put there, it did not show. Being a descendant of Ham is not without its advantages. While this drink was passing away, the rattling of a newspaper behind a counter revealed the hiding place of the proprietor—who probably would say that a soda fountain is more trouble than it is worth. A modern fountain, properly attended to at this stand would probably yield a pretty nice little income.

And Another.—

Just here I might mention that I played a return engagement in this store: you see I did not wish the porter to think he was the only one who could come back. This time the drug clerk played the role opposite mine. The supply of milk happened to be a bit shy, so I told him he might piece out the contents of the glass with vichy. Evidently not suspecting that I knew the difference, he filled it with "plain soda." When I called his attention to this fact, he said that he had supposed that carbonated water was what I wanted, especially as vichy and milk did not mix well. (Doctors and nurses who have been giving vichy and milk to those whose digestion is too weak to get away with plain milk, should take notice.) But that drug clerk had the better of the argument, as he charged me an extra 5 cents for what little milk he did put into the mixture, making the price of the arf-an-arf-an-arf 15 cents. The Broadway price for the real thing was only 10 cents, and that's what the colored man had charged me before at this place. When it comes to being a goat I am a star performer. But then I get the material for a story; what about the general public when they are held up?

Let 'im Wait—What Do I Care?—

At one of the most popular fountains in upper Broadway I stopped for a little liquid refection. I seated myself comfortably at the counter and tapped my toes on the floor for what seemed to me several minutes before the white-coated young man in attendance finished polishing some spoons. It probably was not more than 90 seconds by the watch, but even so, that was just 89½ seconds too long for a clerk to keep a customer waiting while doing work which could just as easily have been done after the

customer had been served. Some bright young soda dispensers rise to high positions in the manufacturing and selling line, while others stick to the dispensing business until rheumatism or some other kind of jinx puts them to the bad.

Great Possibilities in the Soda Business.—

One of the largest dealers in soda water in the United States, the proprietor of a long, strong chain of drug stores, told me that one of the principal troubles he experienced in his business was the difficulty in getting a suitable head for his soda department. "We have been hunting a year or so," said he, "for a man who could make syrups and run fountains, without possessing too many drawbacks in his make-up." By way of comment and emphasis he added: "We wish the young men of the country could realize what a limitless opening, with good pay, there is for those who have skill, judgment, sobriety and honesty to recommend them in the soda business. They are not to be found. In most cases there is some essential lacking. The best soda man we ever knew didn't have two honest hairs in his head." Maybe the man was bald-headed, but let that pass. The point is that young men in the soda dispensing business, instead of preparing themselves for places of responsibility and high pay, keep customers waiting while they polish the spoons.

But that is not part of the story of my life. I beg pardon for the digression. As a buttermilk statesman once said, one step from the beaten path and we are in the tall grass, or words to that effect. Back to your knitting, Terese.

Stung Again!—

The next time it wasn't a milk drink but a ginger ale that my palate craved. I ventured into a little basement shop in a high-class residential section, and indicated my desire. The clerk took a bottle out of the ice box, poured its contents into a warm glass, much of its gas being thereby liberated, and served the drink without ice. It was not very cold, the ginger ale, I mean, not the weather, so I asked for ice, and the clerk broke off a small chunk and dropped it into the glass with his hand. Nothing was said about price, but when a dollar bill was passed over to the clerk, he handed back only 75 cents in change.

What's that about being a goat?

One Thing at a Time.—

In one store in which this "Harun" often finds himself the soda clerk jokes with his girl and boy friends around the counter while serving customers. The fountain is O. K., as are the drinks which come from it, but—well, probably if I said anything about it the fountain folks would think I was a chronic grouch; and the high-salaried positions as head dispensers go begging.

"Whadger Want?"—

On a trip out of town I, being the only original and genuine Observer of Things as They Are in the soda trade, stopped in a very busy corner store in a small city and asked by name for a certain well-known bitter drink. It was not there. I then asked for root beer. Root beer was not served at that fountain. "Well, what have you in bitter drinks?" I inquired. "Whadger want?" came back from the half-grown young man behind the counter. As I thought I had already given a fair idea of what I wanted, I went a few doors down the street and succeeded in getting a root beer so well served and so palatable (palatable largely because well served) that I took another.

Home-Made Slops and Imported Cream.—

"What can you give us in the way of some fancy sundaes?" was asked in another city in a strange store which I, seeking for information and pabulum, had entered with a certain girl I know. "We have no fancy sundaes, only plain ones," replied the soda boy. He dished out some ice cream which would have felt complimented at being called half-frozen, and over this poured some ready-made "marshmallow cream" shipped in a tin can from a factory a thousand miles away, and even at that a good deal better than the home-made ice cream. The whole was served in an exceedingly sloppy manner over a counter that could have been improved by the use of soap and water. The proprietor, an affable and well-meaning man, came up and had something to say about the marshmallow cream, something new in the store of which he was evidently very proud.

A Small Straw Shows the Way a Fly Specks.—

Once I ordered a soda at a pretty good place and was congratulating myself upon the fact that it was served promptly and neatly, when with a quick movement the dispenser caught up a couple of straws which had been serving as roosting places for languid typhoid flies, and was about to stick them into the glass for me to stick into my mouth. I beat him to it, however, getting my hand over the glass a tenth of a second too quick for him. The umpire having decided that I was "safe," I took just enough time before proceeding to imbibe my beverage to advise the young man to dump his fly-specked straws into the sewer and use either a fly-proof container for a fresh lot, or to buy straws sealed in individual envelopes. Is a man blind not to see the flies on the straws, or an idiot to expect fastidious customers to suck the specks off the ends as they drink their soda? That man will not be ready for the big-salaried places near the top until after he has read this little bit of autobiography. If he says "Poof!" when he reads it, he will never be ready, but will hang around until the jinx gets him.

Where Haste Is the Prime Consideration.—

In the big downtown stores of New York, where it is usually a case of grab it, gulp it, and "beat it," rapidity of service is one of the principal desiderata, although much more than this is necessary in order to get people to coming back regularly—and no fountain business can exist, even in lower Broadway, without a goodly proportion of "repeaters" among its customers. I do not patronize these hurry-up places often, but go into them once in a long while to observe how business is done there.

L'Envoi.—

All of which is true, or I should not have written it. But that is not saying that I have written all that is true. And I am sorry—sorry because I am a friend of the soda business and of the men in that business; sorry because I know that that business, as rapidly as it is growing, would grow still more rapidly if those in control of it would only cease holding it back by their own actions; and sorry because I like good soda, served right, and experience so much difficulty in finding it.

One good thing about an inventory is the way it enables the druggist to find some old stuff that has been pushed over behind other goods and forgot. Maybe it is a good seller and has been lost accidentally, or maybe a "sticker" that has simply been worked back to the rear by natural processes. In either case it is well for it to come to light, for, if it is worth face value it can easily be turned into ready money, and if it is a has been, it ought to be made to go at any price and give place to its betters.

As recently as 1884 "hot soda water" was understood to mean a beverage made of such syrups as were used in making cold soda water at that time, into which hot water had been forced under pressure through a "goose neck." An article on the subject, with a diagram showing how the pressure in a city main might be utilized, appears in the CIRCULAR for that year, page 173.

Occasionally some druggist writes to say that one formula in the CIRCULAR has paid him ten times as much as his fifteen or twenty years' subscription has cost. As a suggestion, how about a workman's hand soap or a ladies' quince seed chap lotion? Formulas for seasonable preparations are coming out in each number, but they benefit only the live ones.

Somebody has said that it is not the taste but the odor of castor oil that makes it so disagreeable to take. By the same token it may be that the neat, clean, attractive surroundings of a fountain have a lot to do with making the soda water good; and that the reverse in appearance has a bad effect on the taste of the beverage.

One moment please. Has the reader an own-make "pure food" extract of vanilla better than can be picked up any and everywhere? If not—but what's the use of explaining, since the wise guy has already tumbled and the other sort never will?

Water is cheap. Even carbonated water is not very costly. A little of one or the other "on the side" is often wanted by a soda customer, and for the dispenser to "serve" this want and do the proper thing is to make a friend.

Effective Home-Made Window Fixtures.

Home-Made Window Display Fixtures Which Cost Nothing At All—Diagrams Embodying Suggestions as to How They Should Be Used.

BY THE STROLLER.

What's all this that clerks are saying about not making window displays because the "boss" will not pay for a set of fixtures? Cut it out—there is nothing to it. Any poor

friend. Go dig them out and instead of complaining about that "boss," proceed to show him that there is more in you than merely an ability to pass goods over the counter and fill a prescription now and then. My goodness, gracious, mecius! Brush those cobwebs from the windows and what-ever-it-is from your mind, and get busy.

In the first place, find two boxes that once held, say, a dozen bottles of shoe polish each; then two more in each of which a dozen cartons of some large dollar "patent" was packed; and then two more that once did service as containers for a gross of soap or two dozen cans of pineapple or something of that sort. Anyhow, get a pair of

Diagrams Showing How Three Pairs of Small Packing Boxes May Be Used as Window Display Fixtures.

The Same Six Boxes, Arranged Differently. Small Diagrams Represent the Floor Plan.

A Still Further Variation of the Arrangement of the Six Boxes.

Floor Plans for Two More Arrangements.

workman can blame his tools, but the good workman goes ahead and turns out a passable job with any old tools at all.

There are fixtures for window displays in the cellar,

wooden boxes of suitable and uniform size and shape, say about 10 inches or so high; two more, about the shape of the first two and about 7 or 8 inches high; and a third pair, resembling the others in shape, but a size or two smaller than the last mentioned. Now then, Bill, you have your fixtures. A package of crepe paper completes the outfit.

What may be done with this set of window-display accessories is suggested by the diagrams which I got a fellow to draw for me, presented herewith. The large drawing in each group shows the appearance of the boxes when placed in the window and viewed from the street. The

smaller diagram may be spoken of as the "floor plan"—that is, it shows how the boxes are imposed upon one another from the standpoint of one who is standing over them. Of course, as I said in the first place, these are merely suggestions; any ingenious clerk can take these six boxes and arrange them in such way as to give a variety of effects. Indeed, there is nothing in sight from this point of view to prevent him from amplifying the outfit by adding other boxes if he sees proper to do so. Possibly there may appear in some future issue of the CIRCULAR—if the editor does not shut down on my style of stuff—further suggestions as to what may be done with these six boxes—and a few more.

Just here I may add that for the sake of safety, a little ballast in the shape of bricks or belgian blocks may be concealed in the boxes. Is it necessary to mention that the crepe paper is to be used for covering the boxes and for carpeting the floor space in the window?

In order to learn whether I have touched the spot or not, I should be glad to hear from those who adopt or adapt these suggestions; and should like to receive for publication, with due credit to the sender, photographs or descriptions, or both, of window trims in which this kind of fixtures figure. Now, don't everybody wait to see what the other man is going to do about sending in the descriptions and photos.

Formulas for Hot Novelties.

Formulas are intended largely as suggestions—a sort of basis for experiments. A mediocre dispenser will mutter of many of them, "No good," and pass them up; but the A1 man with a keen understanding of possibilities will say to himself, "Properly varied to suit circumstances, that should make a good seller," and try his hand on the variation.

From among the many formulas that have appeared in the various journals lately, a few have been selected and are presented herewith:

Hot Cherry Phosphate.

Cherry juice, 12 ounces; sugar, 1½ pounds; water, 6 ounces; solution of acid phosphate, 2 ounces. Draw about 2 ounces in a mug, and fill with hot water.

Clam and Ginger.

Clam broth, 1 ounce; butter, about ¼ ounce; ginger, a pinch; hot water, to fill an 8-ounce mug. Serve with pepper, salt and celery salt, with a few crackers on the side.

Malted Egg.

Malted milk, 2 teaspoonfuls; egg, 1 fresh one; hot milk, enough. Rub the malted milk with a little of the hot milk; add more hot milk, and the egg, and shake well. Fill the mug with hot milk, stir, and top with whipped cream.

Hot Ginger Ale.

Soluble ginger ale extract, 10 drops; soluble lemon extract, 10 drops; sugar, 4 cubes (or teaspoonfuls); fruit acid, 10 drops; hot water to fill the mug.

Egg Bouillon.

Into a mixing glass break 1 egg and add 2 teaspoonfuls of extract of beef. Season with pepper and salt. Add 1 ounce of hot water, and shake thoroughly. Strain into a mug and fill with boiling water.

Cream of Tomato Bouillon.

Into a mug pour 1 ounce of tomato bouillon and add 1 teaspoonful of extract of beef and ½ ounce of sweet cream. Fill the mug with hot water and serve with seasoning and wafers.

Hot Lemonade.

Into a mug draw 1 ounce of lemon syrup. Into this squeeze the juice of 1 lemon, and fill with hot water.

While it is poor policy to try to wait on two customers at the same time, unless they are together, it is also poor policy utterly to ignore a customer who is waiting for a drink while other customers are being served. A mere nod of recognition will develop patience in the waiting customer, where, without it, enough impatience might develop to cause resentment and the loss of not only one sale, but many.

Habit-Forming Drinks at the Fountain.

At the recent convention of pure food and drugs officers held at Duluth, the question of the sale of fountain beverages containing habit-forming drugs came up for discussion. The report of what followed, given below, is from the *National Bottlers' Gazette*:

"Dr. S. J. Crumbine, of Kansas, started things along this line. He admitted that the Kansas department had been unable to find cocaine in a certain Atlanta product, which is the genuine coca-cola. He said that numerous instances of the drug's tendency to habit forming had been reported to him, and that in the South he had been informed that people stood in line for hours in front of drug stores in the early morning waiting for them to open so that they might get their 'eye-opener.' He had instances reported to him of boys and girls in his State who were rapidly acquiring the coca-cola habit, and was at a loss to explain it.

"Commissioner Bailey, of Oregon, also reported a failure on the part of his department to locate cocaine in coca-cola, but said that it was undoubtedly habit-forming, and he could not account for it.

"Commissioner De Barr, of Oklahoma, then proceeded to throw some light on the subject. He said that he had been working on the coca-cola subject for three years and that while he never found cocaine in the Atlanta product, he had examined some ninety-three substituted drinks sold by druggists in his State as coca-cola, and very similar to it in appearance, all of which did contain cocaine with the exception of three. All these alkaloidal drinks are habit-forming and harmful, said Commissioner De Barr, and their distinctive names do not mean anything and should be eliminated and descriptions of their contents required. They are, according to Mr. De Barr, among the most pernicious articles on the market for public consumption. He knew personally, he said, of three or four people who had been using these drugs habitually. One young man attending the Oklahoma State University required a double glass of the drink three times a day at regular hours to keep him normal, so excessive had become his use of them.

"Dr. Ross, commissioner from Alabama, was next on the list of protesting food experts, and he testified that the caffeine present in all these drugs was habit-forming and harmful, though the effects as he had noticed them were not as bad as he had heard described during the morning."

Some Dicta for Clerks.

In a recent issue of the *N. C. R. Weekly*, which circulates among the selling employees of the National Cash Register Company, appear the following dicta:

A clerk has many an opportunity to get new customers by favorably speaking of the store and its proprietor to his friends. Always boost the man who employs you. When you get to the point where you do not do this it is time to look for another position.

Punctuality is one of the requirements of a successful clerk. Being the first at the store in the morning is a good recommendation for any clerk.

Do not always wait to be told what to do. Use your judgment if it is backed by sufficient reason.

The desire to do something more, and better, than others were doing, led our ancestors to sail the ocean and conquer new lands.

Ambition raises men above their fellows. It lifts them out of the rut, which is little better than the grave.

Clerks can show their ambition in many ways:

Study details. Personal appearance and cleanliness are of the utmost importance to progress. The impression made on your employer and his customers means everything to you. His customers are your customers.

Be punctual. Make a record for yourself. Always be on time. Your pay envelope represents your value to your employer. This depends on you. A few minutes a day soon mount up to days, and no man will calmly sit by and see days of his valuable time wasted.

Be careful. The greater your care, the fewer losses and errors you will make. There is more loss in retail stores through carelessness than in any other way. Employers encourage men who do not spell loss to them.

Be resourceful. Grasp every opportunity to learn more—about goods, markets, prices, salesmanship—everything useful in or out of your business. When you are too old to learn, your life's work is done.

Be courteous. Set an example to your fellows on polite and considerate treatment of customers. This will soon make you leading salesman in the store, and increase your employer's trade. This means more money for you.

One good thing about the man who is always carrying on an active campaign for more business is that when it does come along he is awake and ready to welcome it.

Courtesy at the Soda Fountain.

By E. H. SHORTISS.

At this time of the year when we are looking forward to a better and busier hot-soda business, the question arises, What can be done to double the sales of last year and at the least expense possible? The public are drinking more hot soda beverages from year to year, and know a good drink; they remember the place where they had a good, delicious, hot one; they remember the service; and they very often go out of their way to Smith's or Black's for another, as they know it will be worth while.

First of all, the dispenser should have a good urn. He should keep it going, good and hot; and he should be sure to supply himself with a good chocolate, best of milk, lots of whipped cream, and the highest grade of beef cubes, malted milk, essence of ginger, tomato ketchup, and the rest. Then he should be generous with his salt, his pepper, his celery salt, his crackers, his napkins and, by all means, with his courtesy. Then his sales will increase.

It is but little or no trouble to ask if the beverage is just right, or too hot, or too cold; to inquire if a little more sugar, or milk, just a little more salt is wanted; or to exchange an unsatisfactory drink for something else. All these small courtesies are appreciated by the patron, and are never forgot.

To the druggist let me say: Don't be stingy or mean. Don't think that women customers do not know a good hot chocolate when they taste it, for they are, as a rule, expert cooks and have made many gallons of cocoa at home. Be pleasant at all times, and just sociable enough. Keep signs on your window and soda fountains. Be sure that your cups and utensils are clean and bright and your silverware well polished. Dispensers should wear clean, white caps, coats and aprons.

By all means, let people know that you are in the hot soda business, not merely as a side line, but that you are featuring the winter business. The average soda man throws up his hands when winter comes. He looks at the cold-weather business as a losing game. If he will only put his best efforts and ideas into the hot line, read the journals, try a new one now and then, and keep at it, he will succeed if there are enough people in his town for him to work on. Hot soda profits are very good, and selling the hot drinks holds the customers for the cold one.

There are many good formulas: I am using these this fall and getting good returns and many compliments:

Hot Chocolate.

Best powdered cocoa.....	8 ounces.
Sugar	2 pounds.
Water	1 gallon.
Milk	1 gallon.
Extract of vanilla.....	2 ounces.

Mix the cocoa and the sugar, add the water and bring to a boil; add the milk, and again bring to the boiling point. Then strain and add the flavor. Put this in the urn, fill the mug and top with whipped cream, sweetened and flavored with vanilla.

Hot Malted Milk.

Malted milk, 2 teaspoonfuls; hot water, $\frac{3}{4}$ mugful; milk, enough to fill the mug. Top with whipped cream, and serve with salt and pepper.

Beef Tea.

One cube of beef extract. Fill the mug with hot water. Serve with pepper and celery salt.

Tomato Bouillon.

Beef extract, 1 cube; tomato ketchup, teaspoonful; hot water to fill the mug. Serve with pepper and celery salt.

Hot Ginger.

Strong ginger syrup, 2 teaspoonfuls; hot water, enough to fill the mug. Top with whipped cream and grated nutmeg.

Beef Malt.

Beef extract, 1 cube; malted milk, teaspoonful; hot water, $\frac{3}{4}$ mugful; milk enough to fill the mug. Top with whipped cream and grated nutmeg.

Oysterette crackers are acceptable to most customers and cost but little. Paper napkins cost \$1 a thousand; window signs or cards, from 50 cents up; menu cards, \$3.50 a 1000 up. The cost of hot soda per mug I estimate to be 3 cents, and gas for heating the urn costs 3 cents an hour.

The Gasoline not All of an Automobile.

By GEORGE W. HUGHES.

While quality is a big word with the up-to-date dispenser of soda water, appointment and service must not be overlooked. Odd-shaped glasses for fancy drink, silver sundae cups, and good plate, are a few of the hundred and one things that help toward drawing the better class of trade, which means better prices. The best ice cream to be made, with fresh fruit slopped over it, served in a cracked glass dish with a brassy spoon, does not taste half as good to most people as a very ordinary sundae served in immaculate surroundings, on a dainty silver tray. While I am a stickler for quality, if it came to a show down, I would sacrifice a little of it for appointment and

E. H. SHORTISS.

GEORGE W. HUGHES.

service, if sacrifice there had to be. Every soda dispenser would do well to bear in mind the fact that while he may be buying the best cream and syrups, all his competitors who amount to anything are buying about the same grade. So, I would advise him not only to buy the best of everything, but to bend his energy toward good service, and to show good taste and judgment in his appointments. The quality of the gasoline can't make a two-cylinder runabout hit the grit like a truly six joy wagon, although it may keep the carburetor from clogging.

Here's a formula:

Banana Martinique.

Split a banana in two, laying the two halves side by side on a dainty china dish. On these put two small balls of ice cream of different flavors with a spoonful of whipped cream on each. Sprinkle thickly with dried macaroons and top with a couple of cherries. This sells for 15 cents or 20 cents, and takes well.

A Successful Soda Dispenser.

Since the soda-water business has grown by such rapid strides to be the enormous affair that we now see it, a study of some of the men who are soda experts and have done much to make the business what it is, seems to be in order. Prominent among these men is George W. Hughes, whose timely notes and attractive workable formulas are published in this department of the CIRCULAR every now and then.

In the first place, Mr. Hughes is the son of a druggist, a man who was one of the pioneer modern-school soda-water dealers of Jacksonville, Fla. As soon as he was born thirty-three years ago, the son was, so to speak, in the soda business, first as a looker-on and consumer, and later as a producer, Hughes père, following the custom of the time and plan, charged his own fountains, using the old-style copper generator which is associated in the minds of so many of us with our early experiences in the soda business. He served no ice cream, but dispensed a cream syrup, made of condensed milk, eggs, sugar and water. Among other things with which the present-day soda man is not so familiar, there was served at the Hughes fountain a mixture known as cream puff, containing much gelatin and drawn from a tank through a regular draft arm. It was snowy in appearance, like beaten egg whites, and was used as a topper.

The lad became a good hand at the fountain, and equipped thus to do battle with the world, he started out.

He has seen something of that part of life visible over a soda counter, in most of the cities on the Atlantic seaboard, and says that he recalls most of his engagements with pleasure and satisfaction. About a dozen years ago he became a New Yorker. At that time the old William Wilson store at the southwest corner of Broadway and Thirty-fourth street was an all-night institution which was just about in the center of everything connected with the gay life and the sordid life of Broadway, Sixth avenue and the adjoining sections of the city. From the soda counter in this store Mr. Hughes saw much of high and low life. He was with Mr. Boisnot when he opened the store in the Ansonia, Broadway and Seventy-fourth street; was with the main store of the Hegeman Company when it moved from its old stand at 196 Broadway to its present large building at number 200; had charge of the Riker fountains in Brooklyn at the time the Bolton stores were absorbed by the larger concern; and went from that position to the Times Building, Broadway and Forty-second street, to manage the new Hegeman fountain there. About three years ago Mr. Hughes went to Pittsburgh and took charge of the soda department for the May chain of stores for a salary and commissions on increased business, a plan which he thinks is a good one. A short time ago he left the May Company to become manager of the Fountain Lunch in the Jenkins Arcade Building, in the same city, on a commission basis, and is "making good."

Regarding the present outlook and future prospects for the soda business, Mr. Hughes says: "It is not a bad business if one sticks to it and gives it the best he has in him."

"The systems and methods of doing business in the different cities and localities are very interesting to those who watch and study them, and the growth and popularity of the fountain is truly remarkable. A few years ago the average dispenser looked upon ice cream as a little out of his line, but to-day few of us would dare try to do without it. In like manner the luncheon is now regarded with suspicion if not actual disfavor by a majority of druggists with fountains, but it seems to me that the sooner the soda man goes after this feature of the business, location and other things being favorable, the sooner he will be able to promenade on the right side of that comfortable and not overcrowded thoroughfare known as Easy street. But the man who starts for the luncheon pennant must keep his wits about him and be fast between the bases."

Six Egg Drinks.

World's Pennant.

Shake well together 1 egg, ½ ounce of vanilla syrup, ½ ounce of pineapple syrup, a spoonful of ice cream, and a spoonful of cracked ice. Nearly fill with the fine stream. In another glass have nearly ½ ounce of crushed strawberries, and into this pour the mixture with sufficient force to blend the whole together into one harmonious 15-cent drink.

Raspberry Egg.

Mix thoroughly ½ ounce of raspberry vinegar, 2 ounces of raspberry syrup, 1 egg, and a spoonful of shaved ice. Fill the glass from the coarse stream and strain.

Happy Days.

Grape syrup, 1 ounce; orgeat syrup, 1 ounce; sweet cream, 1 ounce; fresh egg, 1 only; cracked ice, enough. Fill the glass with the coarse stream, strain, serve, and ring up a 10-cent fare.

Egg Chocolate Milk.

Chocolate syrup, 2 ounces; fresh egg, 1 only; ice cream, about the right quantity. Shake. Fill the glass with milk, and shake again. Top with whipped cream and a little grated cinnamon or nutmeg.

Egg Lemon Phosphate.

Lemon syrup, ½ ounce; grape juice, 1 ounce; fresh egg, 1 only; powdered sugar, 1 spoonful; solution of acid phosphate, a squirt or two; cracked ice, enough. Shake together and fill the glass with carbonated water. Strain, serve, and look pleasant.

Egg Lemonade.

Squeeze 1 lemon in a glass; break an egg over the juice; add enough simple syrup to sweeten, and enough ice to cool. Mix by turning on the fine stream. Powdered cinnamon bark may be used with this. Don't watch the man too intently while he is drinking, it might embarrass him.

Pineapple at the Fountain.

Pineapple is an aid to digestion, due to the bromelin it contains (see the dispensatories). It is also very grateful to the palate of most lovers of fruit and soda water. Canned pineapple is almost as fresh as the fruit shipped whole, and for some purposes is preferable to it, having been picked when it was ripe, while the fresh fruit usually is allowed to ripen after it has started on its journey to market. As many of these points as are suitable to the case in hand may be used in recommending pineapple drinks, either orally or in written or printed advertisements.

Pineapple Parfait.

Place a slice of pineapple on a dish, place on it a portion of vanilla ice cream, and top with a cherry.

Pineapple Fruit Mixture.

Make as the above, except that instead of the cherry, pour over the ice cream a ladleful of mixed crushed fruits.

Pineapple Freeze.

Pineapple syrup, 2 ounces; grape juice, ½ ounce; shaved ice, enough. Fill the glass with carbonated water, alternating the fine stream with the coarse.

Pineapple Sundae a la Brazil.

Place a slice of pineapple on a dish, put on it two small cones of different kinds of ice cream, pour over this a ladleful of crushed fruit syrup, and sprinkle chopped Brazil nuts over the whole.

Pineapple Cheer Up.

On a slice of pineapple on a dish place a cone of ice cream, and pour over this a ladleful of chop suey dressing. Top with a cherry.

Pineapple Delight.

Put a ladleful of ice cream on a saucer with sweet wafers on the side. Pour over this a ladleful of crushed pineapple containing a few cubes. Top with grated nuts.

A customer who is asked to drink soda through a fly-specked straw would be excusable if he never set foot in the store again.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order or New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

	3 months.	6 months.	12 months.

Special prices are charged for preferred positions. Charges for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

NO ORDER GIVEN TO ANY REPRESENTATIVE OF THIS PAPER BECOMES BINDING UNTIL APPROVED BY ITS MANAGER.

QUESTIONABLE OR UNDESIRABLE ADVERTISEMENTS WILL NOT BE ACCEPTED.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 12.

NEW YORK, DECEMBER, 1911.

WHOLE NUMBER 660

Still After Dr. Wiley.

President Taft's decision to keep Dr. Wiley in office must have been a hard blow to those whose financial profits are increased by the adulteration of foods and drugs.

The adulterators and misbranders and those who were in sympathy with them had long been waging a relentless warfare against all who frustrated their plans. Almost every conceivable means had been employed by the "interests" to oust those who seemed determined to thwart their every scheme to get around the law. Their fire centered on Dr. Wiley—the man who gives the public the benefit of the doubt. If everything that has been said and written and done, directly and indirectly, to undermine, belittle, malign, and discredit this man, could be told in type, the story would furnish some of the most sensational reading that the American public has ever seen—and that is saying a great deal. Powerful political, financial and manufacturing interests have conspired against the people, and with Machiavellian ingenuity have invented arguments, distorted facts and uttered innuendoes in their frantic endeavors to undo the man who more than any other has stood between them and their intended victims.

After having failed in all their previous diabolical plans these conspirators seized upon the Rusby incident, and by working secretly had laid a mine under the chief of the bureau of chemistry which, when it was exploded, they hoped, would not only retire him to private life discredited but would at the same time rid his bureau of several other workers who were not amenable to the kind of influence the conspirators know so well how to exert. Their plan was working grandly. There seemed to be not a single thing in the way which could make it go awry. Charges were lodged against the chief and several of his assistants; these charges were investigated; the findings of the investigators were approved by men so high up that there was only one man higher; and the explosion was just about due when—something unforeseen happened: the newspapers and the public learned for the first time of what was going on. Then the explosion occurred, but not with the results anticipated by those who had so carefully planned it. When the smoke and dust had cleared away and the work of removing the debris was begun, it was found that Dr. Wiley was not only unscathed but that he was in a stronger position than ever before; while some of his enemies in his own department who had been trying

to thwart him at every turn—and had succeeded in doing so at many—were shown up in their true light. The one man higher up, the president of the United States, had taken the matter in charge personally and had disposed of it, at least temporarily, in a way calculated to conserve the interests of the people. It was necessary only that the people should see in order that they should win, and they saw just in time. The nearer one comes to success without achieving it, the keener his disappointment, so we may well imagine the feeling of the "interests" when they played what they thought was the winning high card and had it trumped.

But the "interests" while routed were not demolished. They work all the time. They received a blow which was severe but not fatal. They have renewed the attack, not openly in favor of adulteration and misbranding; oh, no, that *would* be fatal. They protest that they favor the principles of the food and drugs act but object only to some of the methods employed in its administration. Robbed of all its verbiage and sophistry the argument of these interests amounts to this: We do not object to the law; what we protest against is its enforcement.

In the August number we had something to say about the Advertisers' Protective Association which claimed to represent firms spending millions a year in advertising, yet had its headquarters in a post-office box. This "association" tried to coerce the press by referring to the amount of damage that was being done to food and drug manufacturers by the law forbidding certain lying on labels, and connecting this alleged damage with a threatened curtailment of advertising appropriations. This is only one of the many agencies through which the interests are carrying on their despicable warfare from ambush. Lately there have been received at this office by mail three sets of reprints, all different, from journals which are notoriously of the get-Wiley-at-any-cost, we-have-our-own-good-reasons variety. Two of these were in envelopes bearing the St. Louis post-mark, while the third envelope was post-marked in this city. None of them bore any sender's name. There is nothing especially remarkable about this, but it is worth noting that there is a certain peculiarity about the wording and typing of our name and address on each envelope which indicates clearly that they were taken from the same list and that the work was done on the same typewriting machine. Seemingly to avert suspicion the sender chose envelopes quite dissimilar,

but in this he so far overshot the mark as to put himself in the category of the lady who doth protest too much. Now who is so vitally interested in the "canning" of Dr. Wiley, and why is he working anonymously and directing his campaign from different cities?

Congress will soon convene again; President Taft has returned from his tour of the country; changes in the department of agriculture which have been officially forecast will soon be in the making, if they are not already; the president with his fine judicial mind sifted the charges against Dr. Wiley and found them both base and baseless, and unless something is done to work up a public sentiment against the champion of pure food and drugs, Mr. Taft will doubtless see that any changes to be made in the department of agriculture will not be detrimental to the Wiley influence. Hence, there is no lack of incentive for an anti-Wiley propaganda.

The making and the executing of all laws in this country rests finally with the people themselves, and now that the people have some understanding of the difference between pure food and drugs and the other kind, and know something of the reasons for rigid laws, honestly enforced, to suppress poisoners, adulterators, misbranders and the like, we may rest assured that there will be no permanent return to the old days when the "interests" had things their own way; and no temporary return to it unless these "interests" succeed in their persistent efforts to stab to death those on guard and chloroform the public generally. No profession is more vitally interested in the success of the people's side of this controversy than the profession of pharmacy. The public's cause should have, and we are glad to be able to say is receiving, the pharmacist's support.

New Yorkitis and Telephonectomy.

Citizens of less favored communities, when they wish to humble or reproach a New Yorker, do not refer to the dirtiness of the streets of the metropolis, as Chicago has dirty streets; nor to the crookedness of the thoroughfares in its downtown districts, as Boston has crooked downtown thoroughfares; nor to both the dirtiness and the crookedness of its politics, as Philadelphia's politics are not free from these characteristics; nor to its horse-cars, as its subway system is more than an offset for that anachronism. No, when the visiting citizen would "snoot" a New Yorker (as Myra Kelly might have said), he opens up like this: "You New Yorkers will stand for anything." When asked to particularize he is not at all at a loss. "See the way you stand for being hustled and pushed and slammed and banged into the cars by the hired minions of greedy corporations," he says. The New Yorker makes some kind of faint explanation, mentioning the crowd and the hurry, but the visitor does not seem to be much impressed, as he continues: "And you New Yorkers pay the highest rents of any folks in the world for your living apartments, yet tremble with dread at the thought of supplanting your landlord to give you the steam heat

and hot water, the electric light and elevator service that you pay for; do you suppose for one instant that Baltimore or Cincinnati would stand for that?" The New Yorker apologizes by calling attention to the limited amount of space available for building purposes in the city, feeling as he does so that his position is a weak one. "And see the way the ticket speculators 'put it all over you' every day in the year and about once every generation when your baseball club happens to be playing in a world's championship series," relentlessly continues the provincial. "Would St. Louis or Pittsburgh stand for that? Not on your life."

If the visitor to the city happened to be a druggist and the question of telephone tolls came up, he would perhaps relieve his mind in some such fashion as this: "That's another place where you New Yorkers give me a pain. You pay for a subway and then pay to be mauled about in it twice a day; you support your landlords in really lordly fashion and send their families to Europe every year, while you meekly take orders and insults from their negro janitors when you are at home, or dodge their automobiles when you are on the street; you submit to whatever anybody has a mind to hand you, and confine your protests to writing letters to the papers to which you do not dare sign your names. You druggists are no exception; you make it possible for the telephone company to do a large and profitable transient business with the public; you pay an exorbitant rate for your own telephone service, supply the company with a pay stand free of rent, supply change and attendance to the customer, and deliver messages around the neighborhood free of charge, and then cringe before the telephone overlord, hat in hand, and plead with him to let you have a little crumb of commission for doing his work for him."

By this time the "come on" has warmed up to his subject in good fashion, and goes on in fine stump-speech style to berate the druggists. Hear him: "Look at Philadelphia. What did the druggists there do? They told the telephone company what they would work for, making sure that it was a plenty, and added that the company might sign the contract or leave it, just as it saw fit. The company saw fit to sign it. And look at Chicago, Pittsburgh, Kansas City, and even little Newark here across the bay! But what's the use of talking to New Yorkers? They'll stand for anything. Why, man alive, if fifty per cent. of your druggists would sweetly smile when Mr. Telephone Agent comes around with his little ten per cent. contract, and show him a twenty-five or forty per cent. one which they had had drawn up, and tell him to sign it or take his instruments out, Mr. Agent would give the first one a merry New York corporation ha-ha; but believe me, this ha-ha would gradually change to a grin of chagrin by the time he had met such a reception for the um-tumth time, and to a doleful tale of woe when he returned to headquarters to report at the end of his day's rounds. The company would make a bluff, all right, but it would come across if the druggists did not, have no

fear of that. You can't expect the company to volunteer to give the druggists two or three times what they have been getting. The company is out for the dough like all the balance of you New Yorkers, and so long as the druggist continues to give up, why should the company concern itself about his welfare? This is a case of every man for himself and the druggist will get just what he deserves, because he will deserve just what he gets. It rests with him to say whether he will accept ten per cent. commissions for working for the telephone company or demand and get twenty-five to fifty per cent., and if he and all his fellows took the right attitude, the company would seek an audience with them, hat in hand, and do the pleading; for when it comes to the public pay 'phone proposition, the company needs the druggist much more than the druggist needs the company. Put that in your pipe and smoke it."

And who shall say that the visitor from out-of-town would not be more right than wrong? The CIRCULAR has often urged the druggists of this city to stand together, to stand firm, and instead of asking picayune favors of the telephone company to issue their ultimatum to the company to the effect that equitable contracts must be signed or the telephones be taken at once from their stores. When the druggists take the position that they are doing a kindness to the telephone company by allowing it to carry on a large and profitable portion of its business which it would be unable to do without their aid, and cease asking the company for its favor, then telephone conditions of which the druggists of New York complain will right themselves, just as similar conditions have righted themselves in other cities. And until the druggists do do something of this kind they might as well try to content themselves with such commission on their telephone business as the company in its magnanimity (?) chooses to allow them. There are indications that the patience, forbearance, meekness, or whatever it is, of the New York druggists has been nearly exhausted by the telephone company. Then there is hope. Bad conditions often have to get worse before they get better.

Our Annual Index.

With this the last number of the current volume of the CIRCULAR, we present as usual an annual index. This, in the number of references it contains, is, we believe, the largest of its kind ever published. We think it impossible for anyone to glance through this index and note the large quantity and great variety of matter to which it refers, without being impressed by the immense fund of valuable information for druggists which our present volume contains. In preparing this adjunct to our year's output we have spared no pains to make it as convenient for our readers as possible, and to that end numerous cross-references are to be found throughout its text. For instance, papers are indexed under the names of their authors, as well as under the subjects of which they treat; and where the subject is such that it probably would be thought of by one reader as coming under

one head, and by another as coming under another, both heads are indexed. As an example, take the article on the adulteration of buchu by Dr. Mansfield: it is indexed under "Mansfield," under "buchu" and under "adulterations" and this system is observed throughout the work.

Those who save their copies of the CIRCULAR and bind them, will find the index most valuable. By means of our bound and indexed volume for this year we expect to be able to answer a large percentage of the queries that will reach us during the ensuing twelve months. Those who do not wish to go to the expense of having a regular book-binder do the work, may turn out a fairly good job themselves by the use of an awl, a large needle, a bit of strong twine, and a sheet of heavy paper. The binder we offer for sale is not only strong and durable, but is so made that each number of the CIRCULAR may be added to it as received without any disturbance of such other numbers as may already be in it. It thus serves to keep all the back numbers together until the volume is complete, after which it may remain on the volume permanently, or the numbers may be taken out and fitted with other covers and the binder used all over again the following year.

In any event, the CIRCULAR is far too valuable, once it has been acquired, to leave around loose to become destroyed; the present index bears testimony to this fact.

IS IT PEDANTICISM, or an aping of the physician who knows no better, or what, that causes so many druggists in writing of drugs to forsake their mother tongue occasionally and use instead thereof overcapitalized and badly crippled Latin words? There is absolutely no justification for a man who is writing in English to refer to potassium bromide as "Pot. Brom.," or to mangle "one pint of best olive oil" almost beyond recognition and offering it to the world as "Ol. Ol. Op. Oj." To do such a thing is to act in an illogical and absurd manner, and to give rude jolts to people of good taste and artistic discrimination. Besides (should the "copy" ever be "edited") it makes work for the already over-worked editor, causes trouble for the patient and conscientious printer, and if proof-readers were not, as is well-known, men of exemplary walk and conversation, it might cause them to lapse into profanity. It seems to us that these are reasons enough for the cessation of the sloppy and indefensible practice, but we hardly hope for its complete abolishment at once on the publication of this note, so we are holding in reserve a few more reasons for use the next time we have to refer to this particularly irritating kind of laches, remissness, shortcoming, laxity, negligence, slovenliness, anomaly, or whatever it is.

TEACHERS ARE FOR THE IGNORANT; those who already "know it all" have no need for their services. The man who really knows it all is either dead or not yet born. Journals are teachers, and especially is the "Notes and Queries" department of the CIRCULAR intended to be a sort of quiz room in which beginners in pharmacy as well as the old-timers may meet, ask questions of each other and of us, and offer for the edification of any who may be edified thereby such

ideas and suggestions as they may think worth while. The questions asked by novitiates and the answers given to them may not interest, much less instruct, the experienced pharmacist, but that is no reason for their exclusion; on the other hand, some of the notes given for the benefit of those who have grown expert in the laboratory, would prove worse than useless—would almost inevitably lead to disaster—in case a youngster attempted to follow the directions therein given. The man who feels that nothing which is not of direct value or interest to himself should appear in his paper should bear in mind that what's one man's poison is another's meat or drink. So let all who will, come and join in the benefits of our "Notes and Queries," remembering that the man who gives to this department is benefiting no less than he who takes from it.

WHO ARE THE MANAGERS of the large wholesale and retail establishments in the trade? Who are the successful proprietors of drug stores throughout the country? Who are the men who are getting the money out of the business? Are they the grouchy clerks of a dozen years or a generation ago? Are they the men who maintained that there was nothing in the drug business but long hours, hard work and poor pay? Or are they the fellows who "plugged" for the house that paid them their wages and instead of complaining of lack of appreciation and opportunities went ahead and did things which commanded appreciation and created the coveted opportunities? We do not pretend to answer, preferring that each reader solve these conundrums for himself. We merely suggest that they read the obituary notices of the successful men when they die, or biographical sketches of them published during their lifetime, and note how often mention is made of humble beginnings and long, long periods devoted to hard work and study—work of a kind that many young men of the present day would not deign to soil their hands with, and study under conditions which would make study impossible for any except those determined to win through sheer merit. Oh, next year seems a long way off to the young man who is laboring under a heavy burden, but ten years ago is as almost no time at all to the older man who has done his climbing and is looking back over the rocky way he has traversed. We believe in a certain amount of wholesome discontent—but for something of this kind we should still be wearing fig leaves and sleeping in caves, if we had even advanced to that stage—but for the chronic grouch who believes that he has no chance because the world is down on him—well, not to be too hard on him, we may say that he, like virtue, is his own reward.

SOON WILL THE FESTIVE ALMANAC MEN of the nostrum makers begin to flood the innocent and defenseless public with their nauseating booklets, each bearing on its back cover the printed endorsement of their truck by the retail druggist. And the pity of it is that many druggists will "fall for it," as the expressive slang phrase is. But there is some consolation in the fact that an increasing number of druggists have seen a light, and have seen that the more intelligent of their customers have seen the same light, and are no longer advertising to the public that they are partners with the nostrum people in their gentle little game of gulling the unsophisticated. The time is not yet ripe for the druggist to refuse entirely

to handle nostrums, but the time is at hand, and has been at hand for some years, when it pays druggists to let it be known that they do not endorse false statements published broadcast by the nostrum makers.

CHRISTMAS is nearly here. It seems but a short time since the year began, and the older we grow the shorter the intervals between annual events appear to us to be. Another twelve-month's work will soon come to a close. It is not our purpose here to indulge in reminiscences of the past or promises for the future, but to wish for all readers of the CIRCULAR an abundance of the good things which are usually associated with the joyous Christmas-tide, and to assure them that we want them to have and shall do what we can to help them to attain, a larger and better year's business in 1912 than they have ever enjoyed before. In short, may they all have a Merry Christmas and a Happy and Prosperous New Year.

GOOD CLERKS ARE VALUABLE in so many different ways that to undertake to enumerate them would prove a hopeless task. To mention just one of these ways: Every man, woman or child who enters the store to make a purchase or to ask a favor is likely to go out either pleased or displeased—either a friend or an enemy of the establishment—a walking advertisement for or against the place. This is true whether the person is a regular customer or a chance dropper-in. How important, then, is it that the clerk who meets the public be attentive, agreeable and winning in his attitude.

THAT ALCOHOL DELAYS PHENOL poisoning is a good thing to remember. According to the daily papers a young woman of this city who mistook a bottle of diluted solution of phenol for another remedy, owes her life to the remembrance of this fact by a quick-witted policeman. It should also be remembered that it is a good thing to empty the stomach of both the poison and the antidotes as quickly as possible.

SELLING A MORTGAGED HORSE subjects a man to criminal prosecution. Selling one article to two publishers is about the same thing.

Sea Salt de Luxe.

Luxury-loving people may prefer their sea salt perfumed. Druggists may profit by encouraging this kind of taste. Coumarin, many of the essential oils, and other perfumers' materials may be used to convert ordinary sea salt into the de luxe variety. They are best applied by dissolving first in a minimum of alcohol. One way of preparing artificial sea salt is by combining 1 pound of sodium chloride, 4 ounces of magnesium chloride, and 1 ounce each of potassium chloride and calcium sulphate.

Preventing the Hardening of Pills.

Pills, very frequently, have a tendency to become so hard as to remain undissolved both in the stomach and in the intestines and to pass the system without having exerted any therapeutic action. To prevent this hardening, Otto (*Münch. med. Woch.*) recommends adding 5 grammes of manna to 100 grammes of pill mass and moistening the mass with tincture of gentian. Pills prepared in such a manner are said to retain their soft consistence indefinitely.

Christmas in the Country Drug Store.

BY W. H. ROWE.

Quaint old Thomas Tusser, an English poet, who wrote the Farmer's Daily Diet away back in the middle of the sixteenth century advises:

At Christmas, play and make good cheer,
For Christmas comes but once a year.

Were I writing a calendar for country druggists, I could find no better advice for the month of December than to change but one word of the practical Tusser and make it read:

At Christmas, work and make good cheer,
For Christmas comes but once a year.

Christmas is one of the great opportunities of the country druggist. Then, if at no other time of the year, he has the advantage of his city brother. Away from the competition of the big department store proprietors who regard December as their harvest time, with more room at his disposal for the storage and display of an increased stock, and supplying the wants of those whose eyes have not been dazzled by the magnificence of the holiday attire of the big cities, if he cannot make his December sales average at least forty per cent. more than those of any other month of the year, there is something wrong with the country druggist, and the day of the twenty-sixth should be one of strict examination of his methods of buying, advertising, displaying, and selling the goods.

BUYING GOODS

Preparation for the holiday season should begin very early. The problem of judicious buying is perhaps greater in this line of goods than in any other. Fads and fancies change from year to year and last season's stock, if held over to this, is as disastrous to the attractiveness of one's display as would be a few withered apples on the top of a barrel of rosy "spies." Before one even attempts to buy, it will be time exceedingly well spent if he thinks over carefully the tastes and habits of those whose patronage he is soliciting and tries to put himself in their place when selecting the goods. If it is not his first year, he may glance back and note what sort of articles has seemed most attractive to them in the past and the prices they were willing to pay. To aid me in planning my buying, I sometimes take a catalogue of one of the mail-order houses and go through its pages devoted to holiday goods, not to order, but that I may get an idea of what will be offered to me when I go to my own jobber to buy. Personally, I find that I can make up my mind more clearly and justly as to the merits of a certain article as I sit quietly and see it described in print than I can when a clever and talkative salesman is descanting upon it to me.

One point in the buying of the country druggist should be made emphatic—he should aim at securing a variety rather than a quantity of any one class of goods. For this reason buying from the jobber rather than from the larger importing or manufacturing house, is more economical for the small dealer. He may buy twelfths of dozens of the jobber, while the large house will require him to take packages of not less than half dozens or dozens. Such things as candies and stationery may, perhaps, be bought to advantage direct from manufacturers, but the little articles that are needed to suit everybody's purse and taste must be gathered in small amounts.

Let not the country druggist despise the things of little price. Expensive toilet sets and jewel boxes

may be the thing for the city merchant who caters to the smart set, but the dime, "quarter," fifty-cent and dollar articles will make a happier day-after-Christmas for the druggist who must look to buyers of the working class. And as the country druggist selects, let him try to put aside his personal tastes in some things and buy for eyes that have not, perhaps, been so cultivated as his own. For example, he would not choose for his wife that elaborately filagreeed jewel box with gorgeous purple satin lining, yet Jim will think it exactly the thing for his Mame. If the druggist's tastes are for subdued colorings and plainness of designs, let him forget it on principle while buying, and select some things that are even repulsive to him because of their brilliance and cheap workmanship. Another bit of advice I have to offer to country druggists preparing for Christmas trade, is to buy early—as soon as the jobber has notified him that his stock is complete. Thus he will get the advantage of first pick of the season's offerings. A great many of the holiday goods are brought from abroad by importers who order only once a year, so in buying them it is a case of first come, first served. If the druggist has plenty of storage room he might have the goods shipped early and the bill dated as of December. Then in the duller days of November he may unpack and mark the articles at his leisure and thus escape the rush that attends the first of the holiday season.

MAKING CHRISTMAS DISPLAYS.

The tendency during the last ten years has been increasingly toward a longer season. The longer season is better for the business man, better for his helpers, and better for the buying public. The first week in December is none too early for a holiday display to be made, and many of the larger stores put theirs out immediately after Thanksgiving Day. Old business men will sometimes say that there will be only lookers during the first two weeks; that the buying is all done during the last ten days, but my cash book for the first twenty-four days of the last eight Decembers does not bear out the truth of this statement. If a merchant lets the people know that he has what they wish early enough, they are not so apt to go away to the city during the rush of Christmas week for things which they know they can find there but are not quite certain they can buy at home.

In displaying the goods, it is well to make the store as festive as possible. With the numerous decorations and festoons now made of crape paper, the holiday effect is easily achieved, and that, too, at a small expense. Some thought should be expended on the stock before it is put on display. With pencil and paper the druggist might make a design of his store and by its aid study out the proper place to show each class of goods. If he has put in a few toys, they should be on a low table where the children may easily see them without using their hands. He should use a little strategy and arrange his Christmas post cards and booklets—articles that every one is certain to want to see—well toward the back of the store so that everything else in the display must come under the eye of the one who seeks these. The higher-priced candies and fine perfumes need not appear in the most prominent place until the last week before Christmas, for these things are almost altogether bought by the men, and they are inclined to put off the "evil day" as long as possible.

Above all things at Christmas time, let the price be plainly and conspicuously shown on each article. People are sensitive about the amount of money they can afford to give for a gift and will often go away without asking the price of something that attracts them for fear it may cost more than they are able to pay. Customers should not be followed about too closely and urged to buy. The clerk must, of course, be at hand if needed, and on the alert if he can be of help, but the results will be better if people are allowed to take their own time about buying, consult with their companions, and exercise the privilege of free-will in their choice.

HOLIDAY ADVERTISING SCHEMES.

The subject of Christmas advertising is almost unlimited. There are a thousand and one ways by which it can be made effective—a thousand and one schemes that bring results. The only thing necessary is for each to choose the one that seems to fit his need best and “work it for all it is worth.” Voting contests in which the school children receive tickets to distribute among their friends, who, by purchasing a given amount, may cast a certain number of votes for the child and thus help him win a prize, have been very effective, especially if the Christmas line is a new enterprise.

Druggists who distribute calendars may in the early part of December have a “Calendar Week.” That is, when the holiday goods have been suitably displayed, the druggist may send neat announcements about the town to say that during the week he will make his annual distribution of calendars and the public may get them by coming to the store for them. It is well for the druggist to hint on these announcements that his Christmas stock is ready, and offer a small bonus of, perhaps, a half-dozen Christmas post cards to each one who during the next two weeks makes purchases amounting to a certain figure. An advantage of this plan is that it encourages early buying. Some years the announcement may take the form of a small booklet in which the druggist has an opportunity to set forth the separate items of his stock that would appeal to different members of the family. The man who thinks it “so hard to buy anything for a woman,” and the woman who “can’t ever think of anything a man wants,” seeing this list of things a dealer keeps that would make the sweetheart or swain happy, naturally goes to the place mentioned in the list for it. Such classified lists printed in large letters and hung up about the store are sometimes of great help as suggestions.

WINDOW TRIMMING.

There is no excuse for one who does not have attractive window displays at this season, when there are so many beautiful things at hand with which they may be made. It is a good plan for the merchant to arrange before the opening of the season some suitable background, as elaborate as he may please, and use this as an attraction around which the goods may be often changed. Moving displays are always strong drawing cards and can easily be arranged for at little expense. So simple a thing as an old-fashioned open fire-place with the bulging stockings hung at the mantle edge did great service for me one year, and has been borrowed two successive seasons by a store in a neighboring village. The Christmas tree in the window is, perhaps, the conventional thing, but unless the window is wide and

well lighted it will not be satisfactory. Once in a while there should be arranged a window display containing gifts for the separate members of the family—for the baby, for the father, for the older sister, and so on. Then there might be arranged groups showing what pretty remembrances may be bought for ten cents or for twenty-five cents. Of course the trim should be kept shining bright and full of the suggestions of the holiday spirit.

LITTLE HELPS, BIG RESULTS.

“Being accommodating” pays at this time as well as any other time of the year. It may seem hard for the druggist to bother with some things when he is so busy, but the time is well spent that is devoted to giving attention to the seemingly trivial needs or unreasonable demands of customers. The druggist might offer to pack goods that are to be sent to a distance; furnish pen, ink and stamps for those who wish to send their gifts away at once; let it be known that packages for the post-office left with him will be promptly and safely mailed; arrange with the expressman to call for outgoing express matter—and advertise that fact; furnish blank cards for those who wish to send their name along with the gift. If he does not have in stock what is wanted, he might order it, even at some inconvenience and expense. Especial care should be taken in doing up and tying packages. Tissue paper should be freely used on the small and dainty things. A spool of white or “hollyed” baby ribbon should be at hand for use on the higher priced articles, and seals or gift dressings of the druggists’ own could be used to better the appearance of holiday packages. Some enterprising dealers obtain a supply of labels bearing the words “Fragile,” “Do Not Crush,” “Not to be Opened Until Christmas,” etc., and use them when desired. Such little favors abundantly pay for themselves and their influence is felt the whole year ’round.

AFTER IT IS ALL OVER.

That the handling of holiday trade in a country drug store is trying, tiring and nerve racking is admitted. The proprietor will probably be so exhausted before the season is over that he will not want to think of buying gifts himself, will not want to play Santa Claus, and will be heartily glad that “Christmas comes but once a year,” but the tinkle of the dollar in his cash register and the fullness of the bill fold in his breast pocket will do much to sooth these feelings and make him half wish that every day in the year was the Saturday before Christmas.

Clean Streets and Tuberculosis.

Stone (*Bost. Med. and Surg. Journ.*) argues that there are at least three conditions of street management for which those interested in the campaign against tuberculosis should strive. (1) The smooth-paving and regular cleaning of all streets, not by dry sweeping, but by flushing, or, if this is not possible, by sprinkling before sweeping. Exactly what can be done in winter, when flushing or sprinkling is not feasible, is a problem not yet fully worked out. (2) A minimum height of buildings and a maximum width of streets wherever possible, in order that those unequaled germ-destroyers, the sun’s rays and fresh air, may have a chance to do their excellent work. (3) The immediate removal of all rubbish and garbage with the consequent lessening of danger from flies.

Elixir of Iron, Quinine and Strychnine Phosphates.

BY RICHARD J. FRITZINGER, M. D.

One need not emphasize a fact of which every tyro of a druggist is conscious, viz., that there is much difficulty and tediousness connected with the production of filtrate of aromatic elixir.

But these two hindrances of the operation are not the most serious problems in the filtration of this elixir. Another, and a greater one (but hinging on them) involves the loss of alcohol that results when the operation is carried on under ordinary conditions in the average laboratory. The laboratory is commonly an appendage of the store and is kept at the store's temperature; and, in fact, in many smaller pharmacies the filtration is conducted in the prescription department itself—possibly, at times, without the required precaution in the matter of a well-covered funnel. The relation of these statements to the formula are apparent when the additional explanation is made that the turbid, unfiltered aromatic elixir is preferable to the filtered one in the manufacture of the elixir of iron, quinine and strychnine phosphates, since it filters much more easily and quickly when in this combination than when mixed for filtration as aromatic elixir.

The method of procedure is simply to follow the process of the Pharmacopœia, with the exception of using the unfiltered instead of the filtered aromatic elixir, and permitting the mixed product to stand over night, or for a longer period. Nor does the advantage of this method lie solely in the saving of alcohol by virtue of the more rapid filtration. No talcum is required as a clarifying agent; and, obviously, there will be a higher percentage of alcoholic strength in the finished product. The additional alcohol in the elixir exerts its solvent power upon the oils in the aromatic ingredients, thus aiding in the clarifying process and enabling a larger proportion of the oils to be held in solution.

In following the official directions several precautions are essential to the production of a fine elixir—such as is due to this excellent formula.

Failures result from over-heating the solution of the iron salt. This salt should be dissolved in hot water, or by the aid of the heat of the water-bath—never over the open flame. A second source of error in manipulation arises in carrying the neutralization process too far, so that instead of exact neutrality, alkalinity results. There is no valid objection, either pharmaceutic or therapeutic, to a slight acidity of the solution, and, so far as I am concerned the only liberty that is taken with the official directions is that neither the solution of iron nor that of the ammonium acetate is neutralized. One of our best manufacturers failed at this point, and a bottle of the product in my collection adorns the tale.

The directions in regard to the phosphoric acid should be carefully noted: Mix the acid with the exact amount of elixir stated.

It is evident from the inquiries and comments still made in regard to this formula that the last word has not yet been said; and these suggestions are made with the hope that they may be of use to those who prepare this elixir in larger quantities, and that they may also possibly remove some of the difficulties of others who seem to have trouble with the manipulations of this formula.

The Lloyd Library Botanical Park and Arboretum.*

BY PROF. JOHN URI LLOYD.

At the beginning of the nineteenth century all the territory lying between the Ohio River and Lexington, Ky., was yet in a primitive condition and consisted of a great natural woodland, dotted here and there with clearings where settlers were commencing their homestead efforts. Beginning at the Ohio

Very Sincerely Yours
John Uri Lloyd

Cincinnati September 18th 1911

River, back of Covington, and stretching southward toward Georgetown and Lexington, a high ridge or water shed extends in nearly a direct line, sloping on the western side into the Kentucky River, and on the eastern side into the Licking River. In the earlier days Daniel Boone and Simon Kenton, for obvious reasons, selected the respective river valleys as exploring pathways. When Cincinnati was laid out, as a "village opposite the mouth of the Licking," John Filson, a renowned civil engineer of Lexington, Ky., who had been previously selected by George Washington to map Kentucky as it was then known, and whose work is recorded in the now rare volume, Filson's History of Kentucky, was employed by John Cleves Symmes to lay out a new settlement which, as stated above, was to be located "opposite the mouth of the Licking River." John Filson, in 1785, deviating from past trails, surveyed a new road, following the Indian trail that meandered along the top of the

* Read at the 1911 meeting of the American Pharmaceutical Association.

ridge aforementioned, and blazed his way to the site of the prospective village, which he surveyed and named Losantiville. Filson's name for the little settlement in the wilderness was, however, brushed summarily out of existence by Gen. St. Clair, who gave it the more pretentious name of Cincinnati, in honor of the Order of Cincinnatus, then in the climax of its aristocratic glory. The village, as marked out by Filson, extended from what is now Broadway, which he named Eastern row, to Central avenue, then Western row.* The plot of ground between these limits, orig-

THOMAS ROUSE. REV. THOMAS HENDERSON.

inally selected by John Filson, still remains the most thickly settled portion, constituting now the business section of Cincinnati, the original survey into streets still standing, practically intact. But while reaping the fruits of John Filson's labor, Cincinnati has not as yet found the opportunity of appropriately honoring the name of the man who laid out the city in the Western wilds, and who, after the work was consummated, making an excursion one Sunday morning into the outskirts, then infested by hostile Indians, silently disappeared, never to return. Indeed, the one street that originally bore the name of Filson was rechristened, the stately name Filson avenue being replaced by the insignificant title, Plum street. But while to-day not a park, not a street, not a tablet, even, in this great city bears the name of the man to whose wise foresight we are indebted for Cincinnati's very location, it is hopefully expected that civic pride in Cincinnati will soon make appropriate recognition of the name of the exploring engineer, John Filson.†

Where John Filson blazed his way, following the Indian trail from Lexington to Cincinnati, came next a horse path, then a mud road, which became, in 1845, a "turnpike road." On this same ridge finally was located the Cincinnati Southern Railway, known now as the Queen and Crescent. On the very crest of this ridge, bisected by these great arteries of travel, twenty-five miles south of the Ohio River, lies a tract of land having the following history:

In the beginning of the nineteenth century Rev. Thomas Henderson, a progressive educator, a Bap-

tist minister of the most pronounced type, crossed the Allegheny Mountains, through Cumberland Gap, to Kentucky. In his capacity he served as preacher, educator, explorer, and philanthropist, being for many years superintendent of the Indian educational system of Kentucky. Under his direction the now long forgotten National Indian School near Georgetown, Ky. (now Great Crossing), was instituted and conducted. The stormy incidents of his career are depicted in the voluminous correspondence between himself and Colonel Richard M. Johnson, famous as the reputed slayer of the Indian warrior, Tecumseh.*

In 1815 a log cabin was built by a settler named Robinson on the selected land that crested the ridge traversed by the Filson path, known now as the Lexington pike.† This cabin, with the land pertaining thereto, was purchased by the aforementioned Rev. Thomas Henderson, who enlarged it to nearly double its former size, in whose possession it remained until his death, in 1846. His estate was then divided among his children, but the portions assigned to the other heirs were severally purchased by Thomas Rouse, who brought the property back into one great block, which thus remained in the possession of the original Henderson family, through the wife of Thomas Rouse, who was Miss Nancy Henderson, daughter of Rev. Thomas Henderson. However, before the death of Thomas Rouse, sixty acres of this land had been deeded to his daughter, Emma Rouse, wife of John Uri Lloyd, and to this portion Mr. Lloyd had added, by purchase from Mr. Rouse, an adjoining tract of forty acres. After the death of Mr. Rouse (1906), and his wife, Nancy Henderson Rouse (1908), Mr. Curtis Gates Lloyd, the principal donor of the Lloyd Library, who had grown up almost as one of the Rouse children, being perfectly familiar with this magnificent tract of land, which had been most carefully cared for since the date of its transfer from the government, conceived the idea of making of it a botanical park and arboretum, as a part of the Lloyd Library equipment. Uniting with him, Mr. and Mrs. John Uri Lloyd donated their portions of the old homestead (including a beautiful natural woodland untouched by the axe), while Mr. Curtis Gates Lloyd purchased the interests of the other heirs (which carried another primitive woodland adjoining), excepting that of Mr. Henderson Rouse, who yet owns his inheritance. He lives in the old home, a part of which yet consists of the original log cabin (now weather-boarded) built a hundred years ago by Robinson in the little clearing of the wilderness of northern Kentucky.

This homestead was a famous road house in the early days of Kentucky, situated as it was on the only direct line north from Lexington, then the center of Western culture and science and refinement. The double log house had been weather-boarded by Mr. Henderson, the interior wainscoted and furnished in extra style, even to a piano (a mark of great distinction), brought in a wagon over the mountains from Baltimore, as were the "boughten" carpets that covered its floors. Here all weary travelers were wel-

* In addition, surveyor. Many early surveys in Cincinnati bears his name as surveyor.—J. U. L.

† In my folklore study of northern Kentucky, known as Stringtown on the Pike, this pike is called "the Stringtown pike," the village of Florence, nine miles south of Covington, being "Stringtown."—J. U. L.

* The labels of the drug store in which I was apprenticed, winter of 1863-4, W. J. M. Gordon & Brothers, bore the name, Eighth street and Western row.—J. U. L.

† Louisville has its celebrated Filson Club; very properly, too, for Filson resided long in Kentucky. See my "John Filson the Neglected," contributed February, 1903, to the Literary Club of Cincinnati.—J. U. L.

comed and here also all the celebrities of those early days were entertained, General LaFayette being there in a guest of honor during his Western journey. In this home every personage conspicuous in Kentucky's early fame has rested and dined, and here, it is to be hoped, the eyes of the scientific future will as pleasantly turn as we now look upon the hospitality of its past record.

To Mr. Curtis Gates Lloyd is thus due the credit for the inception of the plan of this new botanical park and arboretum, as well as the larger share of its

CURTIS GATES LLOYD.

donation. He has also assumed its care and financial responsibility, in the direction of its subsequent evolution, in which its donors hope it will in the future finally become worthily established.

The Lloyd Library, Botanical Park and Arboretum, lying twenty-five miles south of Covington, Ky., at the doors of the famous blue grass region of the State, now carries two natural woodlands, set with the

native herbs, shrubs, trees, and other growth, undisturbed from the date of the opening of Kentucky, together with a large part of several hundred acres of land that for quality has no superior in all northern Kentucky. Mr. Curtis Gates Lloyd, with his well-known energy and persistence, will unquestionably see to it that this tract, with its broad fields and beautiful slopes, shall as time passes develop into a possession conforming to the ideals of its donors. Resting on the crown of the water-shed between the Kentucky and the Licking Rivers, it is now intersected by both the Cincinnati Southern Railway and the famous Lexington pike, a traction line to Cincinnati being also in process of construction. In the deed of donation every effort has been made to preserve to the future the integrity of the included woodlands, which, strangely enough, in this country of forest destruction, have been preserved intact from the days of the Indian.

Lysol Poisonings.

The *Chemist and Druggist* (London) reports that at the September meeting of the Victoria (Australia) Board of Pharmacy a letter was read from the New South Wales board stating that it was reported that ninety-six persons had died from lysol poisoning and asking to be supplied with further details. Letters had been received from the importers of lysol stating that they are willing to restrict the sale to the original package in which lysol is imported. This met with the approval of the board. The chief secretary and the public health department, who had been consulted, thought the offer should be accepted, as it would have the effect of further restricting the indiscriminate sale of lysol in small quantities.

Witchhazel Rose Glycerin.

Mix equal parts of glycerin and rose water and to the mixture add an equal volume of witchhazel water.

Proposed National Formulary Formulas.

Continuing his efforts as a member of the committee revising the National Formulary (see the CIRCULAR for last month, page 651) M. I. Wilbert has sent out for discussion another installment of formulas proposed for admission into that book. These are presented herewith, edited to make them uniform in appearance with other matter of a like nature, printed in the CIRCULAR. We join Mr. Wilbert and the committee in inviting comments on and criticisms of the formulas.

The following are some of the new formulas that have been suggested for inclusion in the forthcoming edition of the National Formulary. The committee is desirous of having them thoroughly tried by pharmacists in different sections of the country so as to avoid as much as possible, unfavorable comment after the final publication of the book. Comments and criticisms based on practical experiences will be welcome. All communications should be addressed to the chairman of the committee, Prof. G. Lewis Diehl, 932 Cherokee road, Louisville, Ky., who will submit the comments to the sub-committee having the matter in charge:

Liquor Sodii Chloridi Physiologica.

Physiological Sodium Chloride Solution.

Normal Saline Solution. Isotonic Salt Solution.

Sodium chloride..... 8 grammes.

Water (recently boiled and preserved

in a sterile container) enough to make 1000 c.c. (mils).

Dissolve the sodium chloride in the water, filter and again sterilize by exposure to heat.

Aqua Phenolata.

Phenolated Water. Carbolic Acid Water.

Liquefied phenol..... 20 c.c. (mils).

Distilled water..... 980 c.c. (mils).

Mix.

Liquor Pepsini Antisepticus.

Antiseptic Solution of Pepsin. Physol.

Pepsin 50.0 grammes.

Menthol 0.5 gramme.

Eucalyptol 0.5 c.c. (mil).

Oil of betula..... 0.5 c.c. (mil).

Alcohol 10.0 c.c. (mils).

Glycerin 50.0 c.c. (mils).

Diluted hydrochloric acid..... 20.0 c.c. (mils).

Purified talc..... 50.0 grammes.

Distilled water..... enough to make 1000.0 c.c. (mils).

Dissolve the pepsin in 800 c.c. (mils) of distilled water, add the diluted hydrochloric acid and glycerin. Then dissolve the menthol, eucalyptol and oil of betula in the alcohol; mix this liquid with the pepsin solution, and add sufficient distilled water to make the product measure 1000 c.c. (mils). Finally, mix the purified talc with the solution, and filter, returning the first portion of the filtrate until the liquid is clear.

Liquor Picis Carbonis.

Liquor Carbonis Detergens. Coal Tar Solution.

Coal tar..... 200 grammes.

Quillaja in No. 20 powder..... 100 grammes.

Alcohol..... enough to make 1000 c.c. (mils).

Mix the coal tar and quillaja with 700 c.c. (mils) of alcohol and macerate during seven days in a closed vessel with occasional agitation. Then filter and wash the contents of the filter with a sufficient quantity of alcohol to make the product measure 1000 c.c. (mils).

Extractum Cinchonae Liquidum.

Liquid Extract of Cinchona.

Red cinchona in No. 40 powder..... 1000 grammes.

Hydrochloric acid..... 30 c.c. (mils).

Glycerin 125 c.c. (mils).

Alcohol 130 c.c. (mils).

Water..... enough to make 1000 c.c. (mils).

Mix the hydrochloric acid and glycerin with 1000 c.c. (mils) of water and moisten the powder with 350 c.c. (mils) of the mixture. Pack the moistened drug in a cylindrical percolator, pour on additional menstruum, and when the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percola-

tor, macerate for forty-eight hours. Then allow the percolation to proceed slowly until the cinchona is exhausted, using the remainder of the menstruum and then a sufficient quantity of the water. Reserve the first 700 c.c. of the percolate, and evaporate the remainder to 400 c.c. (mils) at a temperature not exceeding 80° C., then add the reserved portion and continue the evaporation until the mixed liquid measures 800 c.c. (mils). Finally add the alcohol and enough water to make the finished product measure 1000 c.c. (mils).

Oleum Ricini Aromaticum.

Aromatic Castor Oil.

Saccharin	0.5 gramme.
Oil of cinnamon.....	1.5 gramme.
Vanillin	1 gramme.
Cumarin	0.1 gramme.
Alcohol	40 c.c. (mils).
Castor oil.....	enough to make 1000 c.c. (mils).

Dissolve the oil of cinnamon, saccharin, vanillin and cumarin in the alcohol, add the castor oil, and mix thoroughly.

Pilulæ Digitalis, Scillæ et Hydrargyri.

Pills of Digitalis, Squill and Mercury.

Niemeyer's Pills for Dropsy.

Guy's Pills.

Digitalis, in fine powder.....	6.5 grammes.
Squill, in fine powder.....	6.5 grammes.
Mass of mercury.....	6.5 grammes.
Clarified honey.....	enough.

Thoroughly mix the digitalis and squill, add the mass of mercury, and make into a mass by the addition of clarified honey. Divide this into 100 pills.

Pilulæ Opii, Digitalis et Quinina.

Pills of Opium, Digitalis and Quinine.

Niemeyer's Pills for Phthisis.

Powdered opium.....	1.0 gramme.
Digitalis, in fine powder.....	6.5 grammes.
Quinine sulphate.....	6.5 grammes.
Clarified honey.....	enough.

Mix the ingredients thoroughly and make into a mass by the addition of enough clarified honey. Divide this into 100 pills.

Syrupus Papaveris.

Syrup of Poppy Capsules.

Poppy capsules (deprived of seed) in

No. 20 powder.....	850 grammes.
Sugar	850 grammes.
Distilled water.....	enough to make 1000 c.c. (mils).

Loosely pack the ground poppy capsules in a suitable percolator and gradually pour boiling distilled water until the drug is exhausted. Heat the percolate to boiling for two minutes; then concentrate on the water bath to 500 c.c. (mils), in which dissolve the sugar. Add enough distilled water to obtain 1000 c.c. (mils) of product. Strain while warm and bottle at once. Syrup of poppy capsules should be kept in small vials completely filled and stored in a cool place.

Syrupus Ammonii Hypophosphitis.

Syrup of Ammonium Hypophosphite.

Ammonium hypophosphite.....	32.5 grammes.
Diluted hypophosphorous acid.....	2.0 c.c. (mils).
Distilled water.....	100.0 c.c. (mils).
Glycerin	100.0 c.c. (mils).
Compound spirit of vanillin.....	2.0 c.c. (mils).
Syrup.....	enough to make 1000.0 c.c. (mils).

Dissolve the ammonium hypophosphite in the distilled water; add the diluted hypophosphorous acid, and filter. Then add the glycerin, compound spirit of vanillin, and enough syrup to make the product measure 1000 c.c. (mils).

Tinctura Opii Crocata.

Tincture of Opium with Saffron. Sydenham's Laudanum.

Granulated opium.....	100 grammes.
Saffron, in No. 20 powder.....	25 grammes.
Saigon cinnamon, in No. 60 powder..	6 grammes.
Cloves, in No. 30 powder.....	6 grammes.
Clean sand.....	enough.
Diluted alcohol.....	enough to make 1000 c.c. (mils).

Triturate the drugs in a mortar with an equal bulk of clean sand; then rub them to a smooth paste with a portion of the diluted alcohol, and transfer the mixture to a tightly-stoppered percolator in which has been placed a plug of purified cotton. Rinse the mortar with a portion of the diluted alcohol and transfer the washings to the

percolator. Add enough of the menstruum to leave a stratum of liquid above the drugs; cover the percolator and allow the mixture to macerate for two days; then percolate until 1000 c.c. (mils) of tincture is obtained.

Tinctura Cacti Grandiflori.

Tincture of Cactus Grandiflorus.

Tincture of Night Blooming Cereus.

Cactus grandiflorus.....	500 grammes.
Alcohol.....	enough to make 1000 c.c. (mils).

Cut the cactus grandiflorus and crush it in a mortar; then add 700 c.c. (mils) of alcohol, and transfer the mixture to a closed vessel and macerate for several days with occasional agitation. Express the drug, measure the expressed liquid, and set it aside in a closed container. Pack the drugs firmly in a percolator and slowly percolate with alcohol until enough percolate is obtained to measure, when added to the reserved expressed liquid, 1000 c.c. (mils) of tincture. Finally filter the tincture and store it in well-stoppered bottles, in a cool place.

Tinctura Cocculi Indici.

Tincture of Cocculus Indicus.

Tincture of Fish Berry.

Cocculus indicus, in No. 30 powder.... 100 grammes.

Diluted alcohol.....enough to make 1000 c.c. (mils).

Moisten the ground cocculus indicus thoroughly with diluted alcohol; pack it firmly in a cylindrical percolator, and pour on enough of the menstruum to saturate the drug and leave a stratum of liquid above it. When the liquid begins to drop from the percolator, close the lower orifice, cover the percolator, and macerate for six hours. Then allow the percolation to proceed slowly, adding diluted alcohol from time to time until 1000 c.c. of tincture is obtained.

The use is almost entirely for external application to destroy vermin.

Tinctura Delphinii.

Tincture of Larkspur.

Larkspur seed, in No. 30 powder.... 100 grammes.

Alcohol.....enough to make 1000 c.c. (mils).

Moisten the powdered larkspur seed with enough of the alcohol, and pack it firmly in a cylindrical percolator; pour on enough alcohol to saturate the drug and leave a stratum of liquid above it. When the liquid begins to drop from the percolator, close the lower orifice, cover the percolator and macerate for six hours. Then allow the percolation to proceed slowly until 1000 c.c. (mils) of tincture is obtained.

Rarely used internally, but is commonly employed externally to destroy parasites.

Tinctura Passifloræ.

Tincture of Passion Flower.

Passion flower, in No. 20 powder.... 200 grammes.

Diluted alcohol.....enough to make 1000 c.c. (mils).

Moisten the passion flower with diluted alcohol; pack it evenly and firmly in a conical percolator, and pour on enough of the menstruum to saturate the drug and leave a stratum of liquid above it. When the liquid begins to drop from the percolator, close the lower orifice of the percolator and macerate for six hours. Then allow the percolation to proceed slowly, pouring on diluted alcohol from time to time, until 1000 c.c. (mils) of tincture is obtained.

Tinctura Pulsatilla.

Tincture of Pulsatilla.

Pulsatilla, in No. 30 powder..... 100 grammes.

Alcohol,

Water.....of each, enough to make 1000 grammes.*

Mix 750 c.c. (mils) of alcohol with 250 c.c. (mils) of water and moisten the pulsatilla with enough of this mixture; pack firmly and evenly in a conical percolator, and pour on enough of the menstruum to saturate the drug and leave a stratum of liquid above it. When the liquid begins to drop from the percolator, close the lower orifice, cover the percolator and macerate for six hours. Then allow the percolation to proceed slowly, pouring on the menstruum of alcohol three volumes, water one volume, until 1000 c.c. of tincture is obtained.

*Of course this is not meant. Enough of each to make 1000 grammes means enough alcohol to make 1000 grammes, and enough water to make 1000 grammes.—Editor THE DRUGGISTS CIRCULAR.

Tinctura Sabalis et Santali.

Tincture of Saw Palmetto and Santal.

Sabal, granulated or crushed in No. 16 powder..... 200 grammes.
 White sandalwood, in No. 60 powder. 65 grammes.
 Alcohol
 Water.....of each, enough to make 1000 grammes.*

Mix the sabal and sandalwood and moisten the mixed drugs with enough of a menstruum composed of alcohol four volumes, water one volume, and then pack firmly and evenly in a cylindrical percolator. Pour on enough of the menstruum to saturate the drugs and leave a stratum of liquid above them. When the liquid begins to drop from the percolator close the lower orifice, cover the percolator and macerate for two days. Then allow the percolation to proceed, slowly, pouring on more of the same menstruum from time to time until 1000 c.c. (mils) of tincture is obtained.

Red Cross Seals.

Dr. Farrand, executive Secretary of the National Association for the Study and Prevention of Tuberculosis, denies positively statements to the effect that Red Cross seals could no longer be used on postal matter. They will be issued again this year. On July 1st, he says, the post office department decided that it could no longer carry mail matter "bearing stamps or seals which resembled postage stamps"; but the design chosen for this year's seal does not come within the prohibition, having been definitely approved by the post master general. Every effort has been made, says the secretary, to get as far away from the conventional design of stamps and seals as possible. The new seal will depict a very pretty winter scene. The corners of the seal, which will be square, are in white, thus giving the effect of a circular seal when it is affixed to letters and packages. It is very important that every one bear in mind that the post office department will not carry any mail matter bearing these seals or any other non-postage stamps upon the address side. Seals, if used, should be placed on the back of letters and packages. This will be the third year that the seals have been sold on a national basis. In 1908 over \$135,000 was realized from the sale; in 1909, nearly \$225,000; and in 1910 nearly \$310,000. New York State led the sale last year with 5,955,872 seals, Ohio coming next with 3,743,427, and Wisconsin third with 2,770,112. In addition to these, Pennsylvania, New Jersey, Massachusetts, Connecticut, California, and Rhode Island sold over a million each. Nashville, Tenn., selling 200,000, was the only city receiving over 100,000 seals which sold every one of them.

Use of Hyperol in Analysis.

Hyperol is the name of a compound prepared according to Tanatar from hydrogen dioxide and urea. It contains about 34 per cent. of the former, 65 per cent. of the latter and small quantities of citric acid which is added as a preservative. Milbauer (*Chem. Zeit.*) has found that hyperol can be applied whenever hydrogen dioxide is used in analytical work; chromic salts are converted by it into chromates, sulphides into sulphates, ferrous salts into ferric salts. It may also be used in Jannasch's method of separating metallic salts quantitatively. Hyperol, which occurs as a fine crystalline powder, is marketed as such or in the form of tablets, each of the latter containing 1 gramme of the reagent.

* See foot-note on the opposite page.

International Atomic Weights, 1912.

The International Committee on Atomic Weights reports that a number of important determinations of atomic weights have been published since its report for 1911 was made. A summary of these is given. Gray and Ramsay have determined the density of the gaseous emanation from radium to which they have given the name niton. This gas, says the report, is a member of the argon group and seems to be entitled to recognition in the table.

The table of atomic weights for 1912 follows. In accordance with a suggestion received from Germany the changed values are indicated by an asterisk. It is pointed out that the changes are few, and only in two cases large:

Symbol.	Atomic Weight	Symbol.	Atomic Weight
Aluminum Al	27.1	Neodymium Nd	144.3
Antimony Sb	120.2	Neon Ne	20.2
Argon A	39.88	Nickel Ni	58.68
Arsenic As	74.96	*Niton (radium emanation) Nt	222.4
Barium Ba	137.37	Nitrogen N	14.01
Bismuth Bi	208.0	Osmium Os	190.9
Boron B	11.0	Oxygen O	16.0
Bromine Br	79.92	Palladium Pd	106.7
Cadmium Cd	112.40	Phosphorus P	31.04
Caesium Cs	132.81	Platinum Pt	195.2
*Calcium Ca	40.07	Potassium K	39.1
Carbon C	12.00	Praseodymium ...Pr	140.6
Cerium Ce	140.25	Radium Ra	226.4
Chlorine Cl	35.46	Rhodium Rh	102.9
Chromium Cr	52.0	Rubidium Rb	85.45
Cobalt Co	58.97	Ruthenium Ru	101.7
Columbium ...Cb	93.5	Samarium Sa	150.4
Copper Cu	63.57	Scandium Sc	44.1
Dysprosium ...Dy	162.5	Selenium Se	79.2
*Erbium Er	167.7	Silicon Si	28.3
Europium Eu	152.0	Silver Ag	107.88
Fluorine F	19.0	Sodium Na	23.0
Gadolinium ...Gd	157.3	Strontium Sr	87.63
Gallium Ga	69.9	Sulphur S	32.07
Germanium ...Ge	72.5	*Tantalum Ta	181.5
Glucinum Gl	9.1	Tellurium Te	127.5
Gold Au	197.2	Terbium Tb	159.2
Helium He	3.99	Thallium Tl	204.0
Hydrogen H	1.008	Thorium Th	232.4
Indium In	114.8	Thulium Tm	168.5
Iodine I	126.92	Tin Sn	119.0
Iridium Ir	193.1	Titanium Ti	48.1
*Iron Fe	55.84	Tungsten W	184.0
Krypton Kr	82.92	Uranium U	238.5
Lanthanum ...La	139.0	*Vanadium V	51.0
Lead Pb	207.1	Xenon Xe	130.2
Lithium Li	6.94	Ytterbium (Neoytterbium) Yb	172.0
Lutecium Lu	174.0	Yttrium Yt	89.0
Magnesium ...Mg	24.32	Zinc Zn	65.37
Manganese ...Mn	54.93	Zirconium Zr	90.6
*Mercury Hg	200.6		
Molybdenum ...Mo	96.0		

The committee consists of F. W. Clarke, T. E. Thorpe, W. Ostwald, and G. Urbain.

Pencils for Writing on Windows.

Pencils for writing on glass, porcelain, metal, etc., may be made by incorporating talc in melted wax, adding the desired pigment, as lamp black, zinc white, chrome yellow, vermilion, etc., and rolling, as a pill mass is rolled, to form into the desired shape. About equal parts of wax and talc may be used.

Paper Towels.

Paper towels have become an article of commerce. They are supplied in rolls of suitable size, to be fitted into "hangers," the paper being perforated at proper distances so that a towel may be conveniently separated as required.

Preparing Salvarsan Injections.

Salvarsan when dissolved in water forms an acid solution which is unsuitable for intravenous injections, says Thomas Stephenson in the *Prescriber*; and he recommends the following method for preparing a suitable neutral or slightly alkaline fluid:

Into a sterile 12-ounce stoppered bottle, carefully marked at 300 c.c. (mils), put 30 to 40 c.c. (mils) of boiled normal saline solution. Break the neck of an ampul of salvarsan (containing 0.6 gramme), carefully empty the contents into the liquid, and dissolve by shaking. This will form a clear solution. Now add 23 minims of a 15 per cent. sodium hydroxide solution, made by dissolving pure sodium hydroxide in normal saline solution. This will cause a precipitate, which may be dissolved by vigorous shaking. Then add sterile normal saline solution until the 300 c.c. (mil) mark is reached. Should the solution after dilution not be perfectly bright, a minim or two more of the NaOH solution may be added, but an excess must be carefully avoided.

A solution of salvarsan made as directed the author says contains 0.6 gramme in 300 c.c. (mils). This solution has been used almost exclusively in the Edinburgh Royal Infirmary, where the intravenous method appears to be preferred.

A neutral suspension for intramuscular or subcutaneous injection, says Mr. Stephenson, may be prepared as follows: The contents of an ampul of salvarsan (0.6 gramme) are emptied into a sterile mortar, and rubbed with about 10 drops of 15 per cent. NaOH solution until dissolved. Sterilized water is then added, at first drop by drop, to the desired volume (5 or 10 c.c. [mils]). A fine suspension is formed, which is tested very carefully by means of litmus paper for exact neutrality. If necessary a drop of NaOH solution, or a drop of dilute hydrochloric acid, may be added to effect neutrality. This method has the advantage of simplicity and rapidity, but requires great care in its performance.

Another method mentioned by the author is to triturate 0.6 gramme of salvarsan with 0.7 to 1.0 c.c. (mils) of the NaOH solution until dissolved; add a drop of phenolphthalein indicator, then glacial acetic acid to exact neutralization. This brings down a fine yellow precipitate, which is washed into a test-tube and centrifuged. The supernatant liquid is poured off, and the precipitate mixed with 5 c.c. (mils) of normal saline solution.

A simple method for preparing intramuscular injections, which had been commended to Mr. Stephenson consisted in shaking the contents of an ampul (0.6 gramme) into a dry mortar, and rubbing up the powder with a sufficient quantity of sterile almond oil or liquid paraffin. Great care must be taken to have all apparatus not only sterile but dry, as the slightest trace of moisture will interfere with the proper mixing of the ingredients and prevent the formation of a homogeneous suspension.

Tincture of Iodine for Burns.

Talassano (*Sem. médicale* through *Prescriber*) has found a 2 per cent. alcoholic solution of iodine very useful as an application for burns. He says that it causes only a slight smarting for a few minutes; that the lesion heals rapidly and no irritation is produced.

Shortcuts and Improvements.

In a paper read at the 1911 meeting of the Pennsylvania Pharmaceutical Association, T. A. Egan told some of the ways in which he saved time and surmounted difficulties in preparing a number of official medicaments. Here are his suggestions:

AROMATIC SPIRIT OF AMMONIA.

To the ammonia water, which should be really 10 per cent., contained in a flask, add the distilled water and then the ammonium carbonate in selected translucent pieces, finely powdered. Close the flask and shake until the carbonate is dissolved. Set aside for twelve hours. Add the oils to half the quantity of alcohol, and place the solution in the refrigerator for forty-eight hours. Warm the other portion of the alcohol and add to it the ammonium solution. This prevents precipitation. The alcohol should not be too warm. Add the alcoholic solution of the oils to the other liquid and add enough alcohol, not water, to make the required volume.

AROMATIC ELIXIR.

Take proper amounts of the several oils used in making the specified quantity of compound spirit of orange and dissolve them in the alcohol. Put this solution in the refrigerator—the ice chamber of the fountain answers—and allow it to remain for forty-eight hours. Then let the solution stand at room temperature for twelve hours, and proceed as directed in the Pharmacopœia.

To make 1,000 c.c. (mils) of aromatic elixir, Milton Dunn, in a paper read at the same meeting, directed that the compound spirit of orange and the alcohol be mixed and 15 grammes of kaolin added, and after the mixture is shaken, 543.75 c.c. (mils) [544 will not be an excess] of water are added in small portions with agitation. The liquid is then filtered, the filtrate being returned until perfectly clear. In this filtrate a quantity of sugar equivalent to the syrup [308.75 grammes] is dissolved and the product filtered through a large pledget of cotton.

COMPOUND TINCTURE OF GENTIAN.

Mr. Egan stated that precipitation of the gentisic acid could be prevented in this preparation by replacing 2 ounces of the water in the menstruum with glycerin.

ELIXIR OF IRON, QUININE AND STRYCHNINE PHOSPHATES.

Place the soluble ferric phosphate in a wide-mouthed bottle with 30 c.c. (mils) of distilled water, and dissolve by agitation without heating, as heating prevents the obtaining of the proper "pea green" color of the finished product. Dissolve the alkaloids in the alcohol, warm slightly and add the phosphoric acid. The reaction takes place immediately and there is no precipitation.

Poisoning by Phenolphthalein.

Zabel (*Deutsch. med. Woch.*) reports a case of grave poisoning in a person who had taken about 28 grains of phenolphthalein. The poisoning manifested itself in severe irritation of the gastro-intestinal tract in connection with vomiting and colic-like pains in the stomach, profuse separation of liquid in the intestines and general prostration.

Cheerfulness is contagious. So is gloom.

Iron Caseinate Mixture.

The following formula says *L'Union Pharmaceutique* has been approved by the Copenhagen (Den.) Association of Pharmacists:

Buttermilk	700.0 grammes.
Saccharated iron oxide, soluble.	100.0 grammes.
Cognac	20.0 grammes.
Alcohol	100.0 grammes.
Fresh orange peel.....	6.0 grammes.
Aniseed	0.4 gramme.
Cinnamon	0.4 gramme.
Mace	0.2 gramme.
Clove	0.2 gramme.
Water.....	a sufficient quantity.

The buttermilk is diluted with 500 grammes of water; this liquid is strained, heated to 40° C. and set aside for an hour. The casein is collected on a linen strainer cloth, washed several times with water, and allowed to drain for twenty-four hours. The iron oxide is dissolved in 300 grammes of water, and this solution is triturated with the casein until thoroughly mixed. The orange peel and the other aromatics are macerated in the alcohol to make a flavoring tincture. This tincture and the cognac are added to the iron caseinate liquid and the whole is increased to 1,000 grammes by adding water.

Dispensing by Physicians; the Cure.

To take advantage of existing facts, said H. C. Blair, in a paper read at the 1911 meeting of the Pennsylvania Pharmaceutical Association, is the logical way to proceed in correcting any evil, including that of dispensing by physicians. His advice was to educate physicians in pharmacy as well as medicine and the doctor would know that he can not be successful as a medical practitioner if he attempts to be a pharmacist also.

"Use the confidence, placed by the public in you as a pharmacist," continued the author, "by giving them facts. Tell them that a physician who dispenses is unfit to treat them; advise them to go to a good doctor, who does not dispense; and do not hesitate to keep up your reputation for reliability by urging your patrons to secure the services of the most reliable family doctor you know. Let all physicians know that you are a real pharmacist, able, willing, and conscientious, supplying exactly what they order, of the highest quality and purity; and when you receive their orders, live up to your reputation."

Poisoning by Aspirin.

The *Journ. de la Santé* reports the following case of poisoning by aspirin. A patient, 60 years old, who suffered from rheumatism, had taken 5 grains of aspirin after a meal consisting of fish and cocoa. Half an hour after taking the remedy an edema on the lips was formed, followed by edemas in the face, the tongue and the pharynx. These symptoms, which were at first attributed to fish poisoning disappeared after twenty-four hours. Three days later aspirin was again prescribed for the patient. Half an hour after taking a 5-grain tablet of the antipyretic, symptoms similar to those already mentioned together with urticaria on the arms appeared, which lasted until the next day, which, however, finally disappeared.

More About Oxygenator Sales.

A reader of the CIRCULAR seeing the statement in the issue for October, page 557, that "the sale of the oxygenator in Vermont has been forbidden by the board of health of that State," writes that there has been no cessation of the sale of that "fake" in Vermont; and the question naturally arises as to how we reconcile our statement with the fact.

There is a vast difference between forbidding an action and preventing it. Murder and horse stealing are forbidden in this State, but there has been no cessation of either crime. Then why, our correspondent may ask, are those who sell the oxygenator humbug contrary to the warning notice of the board of health, not prosecuted? We have anticipated that question and upon investigation find that steps were being taken to that end when the supreme court of the United States rendered its famous "cancer-cure" decision. This decision is given in full in the CIRCULAR for July, page 373, and is to the effect that the national food and drugs act does not confer the right on the executive officers of the government to prohibit nostrum proprietors from making false therapeutic claims for their wares. As the Vermont law is practically identical with the federal statute touching this point, and as the false claims made for the oxygenator were of a therapeutic nature, the Vermont authorities decided to discontinue the preparation of the case intended to give the public the benefit of the decision of the board of health that the oxygenator "does not comply with the Vermont pure food laws."

Just after the handing down of the decision of the supreme court in the "cancer-cure" case, President Taft sent a special message to congress in which he strongly advocated the passage of an amendment to the food and drugs act which would make it applicable to the kind of fraud on the people that is perpetrated through the making of false therapeutic claims for nostrums. This message is printed in the CIRCULAR in connection with the supreme court decision.

Where such a palpable "fake" as the oxygenator is involved, there ought to be means for suppressing it even if the food and drugs act does not supply any. Such things as post office fraud orders have been found more or less effective in other cases, and it might not be a bad idea for the post office department to look into the oxygenator matter.

An Alkaloid from Milk.

Awerkijew (*Zeit. physiol. Chem.*) has isolated from milk which had been sterilized at 102° C. in an autoclave and then allowed to stand for three years, a basic substance which gave reactions with the usual alkaloidal reagents, had a melting point at 41° C. and seemed to have the empirical formula $C_{29}H_{49}NO_8$. This alkaloid which has been named esterine seems to be formed by the decomposition of the fats of the milk under the influence of air and light, since samples of sterilized milk which were kept for five years protected from air and light were void of this alkaloidal substance. Milk exposed to air and light for three years contained about 0.03 per cent. of the alkaloid; by excluding the light, only 0.022 per cent., and by excluding the air, only 0.01 per cent. of the alkaloid could be found.

Abstracts

Reaction of Racemic Acid with Barium, Strontium and Calcium.

Kling (*Bull. Soc. Chem. de France* through *Pharm. Journ.*) states that when a cold 3 to 5 per cent. solution of barium acetate is treated with a 10 per cent. solution of racemic acid, barium racemate is not immediately precipitated, although it is only slightly soluble, but it appears as a voluminous crystalline precipitate after standing for several hours. With calcium or strontium acetate, on the other hand, a precipitate of the racemate is obtained in a few seconds. If considerable quantities of barium are present with the calcium or strontium acetate the delicacy of the test is somewhat impaired, but nevertheless 1 part of calcium in 500,000 or 1 part of strontium in 20,000 of a barium salt may be detected by this reaction. It is not possible to effect a quantitative separation of barium from calcium and strontium in this way, because the calcium or strontium racemate always carries down a little barium salt, but the barium may be removed by dissolving the precipitate in dilute hydrochloric acid and reprecipitating with sodium acetate. Calcium in acetic acid solution may be precipitated completely by 10 per cent. racemic acid solution even in the presence of phosphoric acid, citric acid, magnesium, iron or aluminum salts. In the presence of magnesium acetate the precipitate must be dissolved in dilute hydrochloric acid and reprecipitated with racemic acid and sodium acetate. If iron and aluminum salts are present together it is necessary to treat the original solution with ten or fifteen times the quantity of neutral sodium tartrate, dissolve the precipitate in dilute hydrochloric acid, and reprecipitate with sodium acetate in the presence of a little racemic acid. Strontium may also be determined quantitatively by racemic acid in the absence of iron and aluminum salts, but the results are not quite so accurate as with calcium. In the presence of aluminum and iron salts together the quantitative separation of strontium is not possible, even if neutral sodium tartrate is added.

Determination of Nitric Acid.

Romijn (*Zeit. anal. Chem.* through *Journ. Soc. Chem. Ind.*) proposes a method for the determination of nitric acid which involves the reduction of nitrate to nitrite. It is carried out as follows: 5 c.c. (mils) of a solution made by dissolving 100 grammes of ammonium sulphate in 100 c.c. (mils) of ammonia (sp. gr. 0.96) and diluting to 300 c.c. (mils) is made up to 100 c.c. (mils) with the nitrate solution to be examined (which should contain not more than 400 milligrammes of nitrate ion per liter, and must be free from iron), 200 milligrammes of a mixture of equal weights of pure zinc dust and kieselguhr are added, and the whole is well shaken and, after five minutes, filtered into a dry flask, refiltering until clear. The filtrate contains nitrite ions equivalent to 95 per cent. of the nitrate in the original solution. The nitrite, in strong solutions, is then determined by adding 10 c.c. (mils) of N/10 permanganate and 5 c.c. (mils) of sulphuric acid (sp. gr. about 1.124) to 50 c.c. (mils) of the filtrate, shaking vigorously, allowing to stand for 15 minutes, adding 5 c.c. (mils) of potassium iodide solution (10 per cent.), and titrating the separated io-

dine with thiosulphate. 1 c.c. (mil) of N/10 thiosulphate corresponds to 2.30 milligrammes of nitrite ion. The permanganate should be standardized by a blank experiment. Weak solutions are determined colorimetrically by a-naphthylamine and sulphanilic acid. Less than 0.1 milligramme of nitrate ion per liter may be determined by the method.

Action of Carbonated Waters on Metals.

Barillé (*Compt. rend.* through *Journ. Soc. Chem. Ind.*) found that seltzer water, after contact for six months with alloys of tin and lead used for making the tops of "siphons," contained the two metals in quantities corresponding to 0.09 to 0.11 gramme of lead sulphide and 0.031 to 0.038 gramme of stannic acid per liter. According to Moissan 0.002 gramme of lead per liter should be regarded as dangerous, and according to Meillère tin salts in aerated waters may have a toxic action. The rates at which the metals dissolve doubtless depend on the composition of the alloy, but within six months, equilibrium is attained and the water then contains the quantities stated above, whether the lead-content of the alloy is 0.5 or 40 per cent. Less lead and tin are dissolved from plates of the pure metals than from alloys, solution in the latter case being probably assisted by electrolytic action. These results indicate that commercial tin, containing 0.5 per cent. of lead, is as dangerous as alloys containing much more. In Germany siphon-heads must not contain more than 1 per cent. of lead, but alloys of tin with 10 per cent. of antimony may be used. Antimony dissolves from such alloys, however; in two months a seltzer water had dissolved 0.157 gramme of antimony oxide per liter.

Estimation of Formic Acid.

The following process for estimating formic acid has been worked out by Franzen and Egger (*Journ. prakt. Chem.*). The method depends on the conversion of corrosive sublimate into calomel by formates. The formate under examination is dissolved in one liter of water and mixed with a solution of 200 grammes of corrosive sublimate, 300 grammes of sodium acetate and 80 grammes of sodium chloride in one liter of water, using 50 c.c. (mils) for each 0.5 gramme of formate. The mixture is then heated on a water-bath for three hours and the calomel collected, dried and weighed. The solution under examination should not contain more than 0.5 gramme of formic acid in one liter.

Soja Bean Oil.

Matthes and Dahle (*Arch. Pharm.*) have examined soja bean oil and found that it contains about 94 per cent. of fatty acids in the form of their glycerin esters. The solid fatty acids (about 15 per cent.) consist almost entirely of palmitic acid, while the liquid fatty acids (about 80 per cent.) are composed of 70 per cent. of oleic acid, 24 per cent. of linolic acid and 6 per cent. of linoleic acid. The authors further isolated a phytosterol from soja bean oil which they found to be identical with stigmasterol which is present in calabar beans. In addition to this substance which was obtained in crystalline form, melted at 139-140° C. and was strongly levogyrate, another phytosterol with the melting point of 169° C. and several liquid phytosterol-like substances were isolated.

Tetanus from Quinine Injection.

In the *Veterinary Record* is reported an instance of fatal tetanus in the horse brought about by hypodermic injections of quinine. In treating a febrile condition of the animal three subcutaneous injections of quinine acid-hydrochloride, 2 drams each, were given on alternate days. Later a painful swelling arose at the site of each injection followed by some sloughing; and tetanus set in about ten days after the first injection. Particular care had been taken with regard to sepsis, and the quinine was dissolved in boiling distilled water, which was allowed to cool slowly. Experiments made have led to the belief that an injection of quinine exercises a sort of magnetic attraction on tetanus spores that are either in the animal's body, or living in its intestines, drawing them up to the site of injection, which, owing to injury done to the tissues by the quinine has become an ideal anaerobic culture medium where they can grow into toxin-producing bacilli, and thus cause the death of the animal. In the case reported the animal was killed to put an end to its suffering.

Resuscitation from the Effect of Electric Stroke.

Landis (*Weekly Rep. Board of Health of Cincinnati*) says that observations made at the electrocution of two criminals would indicate that death from the current is due to paralysis of the respiratory apparatus. The person injured by a shock is in much the same condition, he says, "which is so quickly fatal in drowning. At least the same immediate treatment is necessary, and that is, artificial respiration. With a heart beating regularly and strongly, artificial respiration holds out every hope of resuscitation. Taken to a hospital, death must certainly take place by asphyxia long before the receiving ward is reached. A case shocked to unconsciousness was resuscitated at the electric plant of the Union Gas and Electric Co. some time ago, artificial respiration being kept up for fifteen minutes. These cases should be treated much as one would treat a person taken from the water—immediate, prolonged artificial respiration on the spot."

Sophisticated Opium.

Carles (*Journ. pharm. chim.*) reports an analysis of opium, which had been bought at Smyrna directly. Some of the cakes were heavy, black, hard masses, while others had a light consistence like colocynths. On examination it was found that some of the cakes contained only traces of morphine, in others the alkaloid was present to the extent of 0.1 per cent., and only in a few choice cakes as much as 5.1 per cent. of morphine could be found. Extract of opium made of this lot was almost void of morphine.

Oil of Cochineal.

Huerre (*Journ. pharm. chim.*) has examined the oil of cochineal, which is present in the drug to an extent of about 8 per cent. He has found the following physical constants: Melting point 32°, iodine number 50.5, acid number 89, iodine number of the total fatty acids 45.9, iodine number of the free fatty acids 44, glycerides 8 per cent., unsaponifiable substances 3 per cent. The fatty acids consist of 57 per cent. of myristic acid, 35 per cent. of oleic acid and 8 per cent. of linoleic acid.

Industrial Poisonings.

Zangger (*Basle Cor.-Blatt* through *Journ. Am. Med. Asso.*) has studied industrial poisoning for more than ten years and reviews his clinical experience at Zurich last year. The neurologic symptoms are often the first that attract the patient's attention, and the true diagnosis is often rendered difficult by the similarity between the effects of certain chronic poisonings and infectious diseases, and by the great variability in the reaction of different individuals to the same poison, and by the difficulty in discovering the poison involved, as it is frequently used in the industry under a fancy name or only for a certain brief period. Lead is used in 150 different industries, and many girls work with it without knowing that they have anything to do with lead, as in making or packing stiffened tissues, laces, fringes, bottle-stoppers, paints for china, papers, varnishes, cements, and repairs for parts of electric apparatus. Carbon monoxide poisoning from portable steam engines occurred in several workers in tunnels, and in others from salamanders used in drying new plaster. The escape of water gas into a factory room caused severe headache and vomiting with speedy recovery in some of the workmen but in others weakness in the legs developed, with total amnesia, the syndrome not subsiding for weeks. Forty-five cases of severe carbon monoxide poisoning were encountered in which the patients survived; the majority presented tardy symptoms. Anilin and nitrobenzol are used in the manufacture of washing powders, hair oils, shoe blacking and various other things. These substances are particularly dangerous here as they are used under fancy and various names as perfumes and essences, so that no one suspects their poisonous nature. In two cases death was directly traceable to the nitrobenzol used in making a washing powder or shoe blacking, and in a third case a child had bloody urine the day after some shoe dressing had been applied to the bare feet. The less saturated the substance the greater the tendency to chronic disturbances, both local and general. This explains why the acute poisonings often display peculiar features, due more to the special physical properties of the chemical; the chronic ones are more the result of the chemical properties than of the physical. The majority of industrial poisonous substances, the author remarks in conclusion, are fatal only with relatively large doses, but they induce special and often typical syndromes, particularly of nervous character, when the system is long subjected to their influence.

Separation in Phenol Ointment.

Reports of the separation of phenol from fatty vehicles are common, the phenomenon being particularly marked in phenolic ointments made with petrolatum. It is not quite clear whether this is due to the resumption of the homogeneous state of the fatty substance with a consequent squeezing out of the phenol interposed between fatty particles separated by the process of admixture, or to hygroscopy and salting out. That it sometimes results untowardly is well known, particularly in warm climates. Dalma-hay-Allan reports (*Brit. Med. Journ.*) a severe phenol burn resulting from the application of the top layer of a separated ointment to an insect bite on the hand. Phenol ointments are very dangerous even when separation does not occur, as gangrene may result from their application.

Determination of Nitrogen in Nitrites.

Dey and Sen (*Zeit. anorg. Chem.* through *Journ. Soc. Chem. Ind.*) find that by the interaction of barium nitrite solution and hydrazin sulphate, barium sulphate is precipitated and hydrazin nitrite formed, the latter slowly decomposing (more rapidly with rising temperature), a mixture of nitrogen and nitrous oxide being evolved. If an excess of the hydrazin salt be employed, the decomposition of the nitrite appears to proceed according to the equations, $N_2H_4 \cdot 2HNO_2 = N_2 + N_2O + 3H_2O$ and $N_2H_4 \cdot HNO_2 = NH_3 + N_2O + H_2O$, and, the proportion of nitrogen evolved as such being the same for other nitrites as for barium nitrite, the reaction, says the authors, furnishes an accurate and convenient method for the determination of nitrite nitrogen in nitrites generally, including those of organic bases. The nitrite solution is treated with an excess of hydrazin sulphate in a nitrometer, and, after dissolving the nitrous oxide by introducing water and shaking until the volume of gas remains constant (three washings with 20 c.c. [mils] of water each generally suffices), the residual nitrogen is measured; this volume represents two-thirds of the total nitrite nitrogen. A determination may be made in 15 minutes.

Identification of Atoxyl.

For distinguishing atoxyl from compounds having similar chemical composition, Fiori (*Boll. chim. farm.*) recommends the following reactions: In a cold aqueous solution of atoxyl the addition of a solution of calcium hypochlorite produces an orange-red coloration or a yellow precipitate. Sodium methylarsinate and sodium cacodylate do not give any colorations under the same conditions. Mercuric chloride gives with atoxyl a white precipitate, which is soluble in hydrochloric acid and ammonia; with sodium methylarsinate a brick-red precipitate is produced, which is also soluble in hydrochloric acid and ammonia; no reaction is produced with sodium cacodylate and mercuric chloride. If the solution of a small quantity of atoxyl in concentrated hydrochloric acid is boiled, then diluted with water and finally mixed with a solution of calcium hypochlorite, an intense violet color is produced. By fusing a small quantity of atoxyl with caustic soda, the arsenic is converted into arsenic acid, which can be identified in the usual way.

Detection of Arbutin in Plants by Micro-sublimation.

Tunmann (*Berichte Pharm.* through *Pharm. Journ.*) says that while arbutin cannot be sublimed for micro examination without decomposition, the hydroquinone formed by its hydrolysis with dilute hydrochloric acid can be easily detected in that manner. The finely disintegrated material is treated in a micro cell with 2 or 3 drops of hydrochloric acid 1:10 and allowed to stand for a few minutes. The mixture is then warmed on an asbestos plate, a second slide, fixed 3 mm. above the material, being used to condense the sublimate. In the presence of arbutin very characteristic crystals of hydroquinone will be obtained. The author has been able easily to demonstrate in this way the presence of arbutin in *arctostaphylos uva ursi*, *vaccinum myrtillus*, *kalmia angustifolia*, and *pyrola rotundifolia*.

Preparation of Oxalic Acid.

Hedenström (*Chem. Zeit.* through *Journ. Soc. Chem. Ind.*) reports laboratory experiments undertaken with a view to ascertain the most favorable conditions for the production of oxalic acid from sawdust. 3.72 grammes of crystallized oxalic acid were obtained from the oxalate formed by heating 3 grammes of purified cotton-wool with 12 grammes of potassium hydroxide (dissolved in 20 c.c. (mils) of water) with constant stirring to 280° C., in a nickel crucible. Only about 1 gramme of acid was obtained when the temperature was not allowed to exceed 225° C. 3 grammes of air-dry oak sawdust (losing 5 per cent. at 100° C.) similarly treated yielded 3.66 grammes of acid when heated to 280° C., but only 2.3 grammes by heating only to 235°—240° C. Preliminary extraction of the sawdust with dilute potassium hydroxide solution was found to reduce the yield. No decomposition of oxalic acid was found to occur when 4 grammes of the acid were heated with 12 grammes of potassium hydroxide for half an hour at 280° C.

Powdered Ipecac of French Commerce.

Planchon and Juillet report (*Bull. pharm. Sud-Est.* through *Pharm. Journ.*) that out of forty-eight samples of powdered ipecacuanha root examined, only sixteen met the requirements of the French Pharmacopœia, which restricts the product of powder to 75 per cent. of the weight of the original root taken. In this manner it is intended to avoid the occurrence of an undue proportion of woody fiber in the powder. Another sixteen showed the presence of an undue proportion of tracheids and woody debris, indicating that the whole root, including the greater portion of the medullium, had been ground to powder. The remaining sixteen samples were more grossly adulterated. They contained ground olive stones in quantity varying from 3 to 40 per cent.

Essential Oil of Wall-Flowers.

Kummert (*Chem. Zeit.*) has isolated the essential oil of the flowers of *cheiranthus cheiri*, which he describes as a yellow liquid, with a disagreeable odor and exhibiting in alcoholic solution a bluish fluorescence. The following constants were found: Specific gravity 1.001, acid number 9.36, ester number 20. From the oil the following constituents could be isolated: Mustard oil-like compounds, ketons and aldehydes with odors suggesting those of violets and hawthorn, nerol, geraniol, benzoyl alcohol, linalool, indol, anthranilic acid methylester, acetic acid, salicylic acid, phenols and lactones. Strongly diluted with alcohol the oil exhibits the agreeable odor of wall-flowers.

Fatal Poisoning by Salvarsan.

The following case of death which occurred after administering salvarsan is reported by Luque-Morato (*Rev. de med. y de cirurg. prat.* through *Rép. de pharm.*) A patient, 21 years old, suffering from secondary syphilis without complications, had received an injection of 0.4 gramme of salvarsan. Three hours after the injection the patient, whose heart, lungs and kidneys were in good condition, was attacked by vomiting, diarrhea and violent palpitations. The temperature dropped very rapidly, the face became very pale and after thirty hours the patient died.

Röntgen Ray in Hypertrophied Prostate.

Hunter at a meeting of the Röntgen Ray Society said that in selected cases of hypertrophied prostate röntgenotherapy was of great value. When the increase in size was due largely to overgrowth of the epithelium the röntgen ray would quickly diminish the size of the gland, but not so if there was much increase in the amount of connective tissue. The results from the treatment depended largely on the histological structure. Massage was indicated as an adjuvant. The mortality was nil.

Artificial Serums.

Pharmacists, who are often called upon to prepare at a moment's notice some particular artificial serum

ward, the body bowed forward, over the cushion under the shoulders. Another point is that the arms are held with the four fingers above the elbow, on the inside, the thumbs on the outside of the arms. This permits a stronger control of the arms in pushing them toward the floor. This modified technic floods the lungs much more profusely with air.

Test for Caulophyllin.

Gibbard (*Analyst*) proposes the following method for the detection of the resinoid caulophyllin in galenical preparations: Evaporate to dryness 5 c.c. (mils) of an extract of the material made with 80 per cent. alcohol. Stir the residue with 1 c.c. (mil) of water, and then treat it with 2 c.c. (mils) of strong

Constituents of Artificial Serums.

*In this country normal physiologic salt solution usually contains from 0.6 to 0.8 part of sodium chloride in 100 parts of sterile water.

desired by physician or surgeon will doubtless find the accompanying table useful. It is taken from the *Prescriber*.

Artificial Respiration.

Meyer (*Berlin klin. Woch.* through *Med. Bull.*) has modified the Sylvester method of restoring respiration, drawing the arms upward, but pressing them down toward the floor, the body thus assuming the opisthotonus attitude, the head and heels bent back-

ward, the body bowed forward, over the cushion under the shoulders. Another point is that the arms are held with the four fingers above the elbow, on the inside, the thumbs on the outside of the arms. This permits a stronger control of the arms in pushing them toward the floor. This modified technic floods the lungs much more profusely with air.

Bismuth Subnitrate to Preserve Fats.

Hudelo, Levy, and Tularne (*Journ. pharm. chim.* through *Pharm. Journ.*) say that natural fats may be kept unaltered for a very long time by adding from 1 per cent. to 5 per cent. of bismuth subnitrate.

The Modern Materia Medica.

Biohydron, Coleman, is said to contain acetic ether, ferric citrate, calcium citrate and citric acid.

Biolactyl is a culture of the lactic acid bacillus. It is furnished in liquid form and as tablets.

Biosine le Perdriel is said to be iron and calcium glycerophosphate.

Blaudiol is a liquid preparation said to contain the ingredients present in Blaud's pills.

Bromotal is the name of a cod liver oil emulsion, with bromoform.

Brophenin occurs as a colorless and tasteless powder, which contains isovalerianic acid and bromine.

Bulgarine is the name for cultures of the lactic acid bacillus. It is marketed both in the form of tablets and as liquid.

Capsules Sérafon contain iodoform and guaiacol.

Cascarmat is an elixir of cascara sagrada free from bitterness.

Cremula is the name for troches which consist of equal parts of chocolate and milk paste, the latter being prepared from milk and sugar by partial evaporation. These troches can be medicated in the usual way.

Eukadol is the name for a tar preparation which does not possess the odor of tar.

Ferrocitin contains iron and lecithin.

Formosan, Simon, exploited for the treatment of obesity, is said to contain the active principle of sea-algæ containing iodine, and laxatives.

Gayatine is an aqueous solution of sugar and potassium sulphoguaiacolate.

Glycerophosphate Oil Emulsion is said to contain calcium glycerophosphate, olive oil and glycerin.

Hallecethin is lecithin hematogen.

Iodalose, Galbrun is said to be a stable combination of iodine and peptone.

Iodized Olive Oil, Sasso, occurs as a transparent, yellowish-green oily liquid, said to contain 0.15 gramme of iodine in each 100 grammes of olive oil.

Jecovol is a cod liver oil emulsion containing in addition, the glycerophosphates of sodium, calcium and iron.

Laminol is offered as a substitute for cod liver oil. It is said to contain 0.05 per cent. of iodine, 2 per cent. of free fatty acids and 0.01 per cent. of phosphorus.

Lenirenin is said to contain lenicet, freshly precipitated and dried aluminum hydroxide, cocaine and extract of the suprarenal glands.

Man Tam Pastilles are said to consist of manna, tamarind pulp, senna leaves and wheat starch.

Neuripin is made from fresh nerve fibers with the aid of olive oil and is rendered stable by the addition of bromine.

Otagan is the name for a stable, clear solution of extract of opium and antipyrin in glycerin.

Radiopyrin is said to be "radio-active" acetyl salicylic acid. It is marketed as tablets.

Proposote is a preparation resulting from the treatment of creosote with phenyl-propionic acid.

Ristin or Ethyleneglycoll-mono-benzoic acid ester is prepared by reaction between ethylene-chlorhydrin and sodium benzoate. It occurs as a crystalline mass, melting at 46° C. and possessing a faint aromatic odor. It is used in alcoholic solution for the treatment of scabies.

Salimenthol-Carbon Tablets contain vegetable charcoal and salimenthol.

Satopan is the name for an iron-quinine preparation which also contains bromides, calcium salts and glycerophosphoric acid.

Sotopan is said to contain quinine, iron, bromine, calcium and phosphoric acid. It occurs as a brownish liquid, with an agreeable odor and taste and is also marketed in the form of tablets.

Stearosan is santalyl stearate.

Sudian is a potassium soap containing sulphur.

New Shoe Polish Formulas.

From a little book on "Casein" by Robert Scherer, translated from the German by Charles Salter, the information given below is copied:

Beuse's Shoe Polish.

Shoe polish may be made to give a greatly improved gloss by the addition of a solution of casein, prepared by boiling in water with borax or soda. At the same time the addition of iron resinate imparts the property of staining the leather a deep black, instead of merely forming a black coating.

The iron resinate is prepared by adding an aqueous solution of green vitriol (ferrous sulphate) to a resin soap obtained by boiling resin with soda. The other ingredients of the polish are as usual: ivory black, syrup or dextrose, fat or oil. A blue-black sheen may be imparted to fine polish by the addition of a little Paris blue dissolved in water.

The following is a typical recipe for these polishes:

Casein	16 parts by weight.
Soda crystals.....	6 parts, dissolved in
Water	48 parts, and mixed with
Ivory black.....	145 parts.
Dextrose	75 parts.
Olive oil.....	12½ parts.
Iron resinate.....	5 parts.

This should be further mixed with 5 parts of ferric cyanide, dissolved in 1 to 2 parts of oxalic acid and 5 of water, the whole being stirred in a suitable stirrer. For solid polishes, the proportion of solid ingredients is increased.

Casein Shoe Cream.

Casein exhibits the property of furnishing with thick turpentine a handsome, shining compound, suitable for various purposes, especially shoe polish. For this purpose 4 parts of galipot are melted, strained through a sieve, and boiled with 3 parts of water and 2 of caustic soda lye (density, 37° B.) until a film has formed on the surface, whereupon another 1 part of the soda lye and 50 to 60 parts of warm water are added; 15 parts of soda crystals are dissolved in the liquid and 10 parts of powdered casein are stirred in until dissolved. This is followed by 10 parts of grey carnauba wax, and the whole is boiled until homogeneous. If a cooled sample be found too stiff, a little water is added. An anilin dye that is fast to alkali may be used for coloring.

The name ferric cyanide given in the first formula is a common misnomer; the compound meant is ferric ferrocyanide—prussian blue. We would suggest a replacement of this by the more modern "soluble blue," and the omission of course of the (poisonous) oxalic acid which would be thus rendered useless. It may be well to explain that the term galipot in the second formula is a synonym for crude burgundy pitch.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Several Complications.—L. H., New York, submits for consideration the following prescription:

R̄ Tinct. ferri chlorid.....	12.00
- Potassi chloratis.....	0.50
Glycerini	15.00
Liq. antiseptic, U. S. P.....	q.s. ad 120.00

This is a common prescription, he says, and one that presents many "difficulties" in which he desires assistance.

Truly this is an example of multiple interaction more or less disconcerting if not unfavorable to the desired results. The enumeration of a few of the troublesome incompatibles will suffice to show the mixture's lack of stability. The most noticeable result of incompatibility is the darkening of the mixture. This is due to the interaction of the oil of gaultheria and the thymol of the antiseptic solution with the tincture of iron, and is enhanced by the hydrolysis of the ferric chloride into ferric hydroxide and hydrochloric acid, the glycerin aiding in the hydrolysis. The muddiness that becomes apparent after six to ten hours is due chiefly to the formation of iron compounds with the boric and benzoic acids, and with the decomposition products of the reaction between the tincture and the potassium chlorate.

We do not believe that the incompatibilities between these ingredients are especially dangerous to the user. They can not be prevented, but they may be considerably inhibited and actual precipitation practically prevented by increasing the amount of glycerin, dissolving the potassium chlorate in the antiseptic liquid and adding to this solution the glycerin and the tincture of iron previously mixed intimately. We suggest that the shortcomings of the prescription be pointed out to the prescriber, and that he be enlightened in the manner of improving the combination as hereinbefore mentioned.

Burow's Solution.—"Subscriber," New Jersey.—As quoted in the CIRCULAR on more than one previous occasion, Hager's formula for this preparation, which he calls liquor aluminæ aceticæ, Burow, is as follows:

a Lead acetate (crystals).....	100 grammes.
Distilled water.....	300 grammes.
b Alum (potassium).....	66 grammes.
Sodium sulphate (crystals)....	12 grammes.
Distilled water.....	500 grammes.

Stir a while, and let the solution remain in a cool place for two days, then filter, without washing out the sediment.

Mix the two solutions.

This preparation should be made during the cold season of the year; at a temperature above 10° C. (40° F.) a little lead sulphate enters into it.

The CIRCULAR has also printed the following formula, contributed by A. Halpern, New York who

says that by following it there is obtained a product giving a negative test for both alum and lead sulphate:

Aluminum sulphate.....	125 grammes.
Lead acetate.....	220 grammes.
Water.....	enough to make 1,000 grammes.

While on this subject we might say that Dieterich gives these directions for preparing this solution: "Dissolve 60 grammes of aluminum sulphate in 500 c.c. (mils) of distilled water, and 100 grammes of lead acetate in 300 c.c. (mils) of distilled water. Cool both solutions down to 10° C., and slowly pour the lead acetate solution, with stirring, into the aluminum sulphate solution. Set the mixture aside in a cool place for three or four days, then filter. In the cold the mixture deposits more lead sulphate and hence it should be kept in as cold a room as possible for the period stated."

In this connection the formula for solution of aluminum acetate, N. F., is of interest, although this solution and that of Burow's are not at all identical. An exhaustive note on the N. F. formula by Dr. George C. Diekman was published in the CIRCULAR for May, 1908, page 224, and this was followed in the issue for the next month, page 275, by a further contribution to the subject from Otto Raubenheimer, in which some comparisons of various related formulas were made.

Preparing Sulphurated Lime.—C. A. P., Florida, writes: "In the preparation of calx sulphurata a small amount of starch is used, presumably to assist as a 'carrier' in the reduction of the calcium sulphate. What I want to know is, what becomes of the starch, as no mention is made of it in the formula—

"Is the starch altered, or does it remain unchanged? And if unchanged, why does not the finished product respond to the iodine test? Also, if unchanged, how does it resist the high heat necessary for the reduction? Please express its use in a chemical formula."

The starch is used in making sulphurated lime because, in the temperature at which the reaction takes place, the starch is carbonized and the nascent carbon aids materially in the reaction, producing a large proportion of calcium sulphide. Whether this aid is most effective at the beginning (in starting) or at the end of (in finishing) the reaction, is not clearly known, but that the freshly-liberated carbon aids in reducing the calcium sulphate is a fact. Any substance which would carbonize without complete burning, as gums, sugars, organic acids, etc., could be used, with a similar result. Starch is selected because it is cheaper than the other available substances, and because it does not change the appearance or odor of the product, while sugar, for instance, would produce caramel as well as carbon, and so would darken the product.

Of course, when the starch is carbonized it ceases to be starch, and so will give no reaction with iodine. Probably the only starch-product which remains is carbon, in the form of charcoal, a part of which (or possibly the whole) has reacted with the calcium sulphate.

Sulphurated lime is not a definite body, but consists of a mixture of calcium mono-sulphide and (unchanged) calcium sulphate. The object being to produce as large a proportion of the monosulphide as possible, and the use of nascent, or freshly-liberated,

carbon having been found an aid to this end, starch is added to the charcoal called for by the official recipe.

As to the chemical reaction by which the carbon is liberated, no one knows exactly what it is. The generally accepted formula for starch is $(C_6H_{10}O_5)_n$, but what "n" means is indefinite. One chemist states that the molecular weight of starch is upward of 3000, which would make "n" at least 19, and the formula for starch $C_{114}H_{190}O_{95}$. When heated these elements split up in a complex manner, according to the intensity of the heat and the supply of air. At a high heat, and with a full supply of air, the products would be carbon dioxide and water, thus—

At lower temperatures the products are more complex, particularly if access of air is hindered. Then free carbon is liberated, some water is driven out, and some oxides of carbon are probably formed. The simplest reaction (using the simpler formula) would be $C_6H_{10}O_5 + \text{heat} = 6C + 5H_2O$, but probably this reaction is impossible in practice. The actual reaction depends upon the degree of heat, the time of heating, the supply of air, and probably upon the influence of the calcium sulphate. Any expressed reaction would be fanciful. But it is known that under the conditions stated in the Pharmacopœia, free carbon is liberated from the starch, and the reduction of the calcium sulphate is promoted thereby.

"Who Owns the Prescription?"—R. C., Oregon, wants to know "whether there has been any court decision upholding the druggist in refusing to give a customer copy of prescription when the physician uses a blank on which he has printed, 'Not to be refilled nor copy given.'"

We do not know of any such decision, and appeal to our readers for such information on the subject as they may be able to give.

Those statutes with which we are familiar that touch upon the custodianship of the prescription specify that the druggist who fills it must keep it on file. The North Carolina law requires this, and also that upon request of the physician or patient, the druggist shall supply a true copy of it. Our own opinion as to the ownership of the prescription, previously expressed, is that it belongs to the one who has it until someone else establishes a better right to its possession.

Syrup for Disguising the Taste of Quinine.—A. D. C., Georgia.—Perhaps the following formula, or such modification of it as your experience may cause you to make, will answer your purpose, although the resultant preparation is far from tasteless:

Powdered chocolate.....	2 ounces.
Sugar	1½ pounds.
Tincture of vanilla.....	1 ounce.
Aromatic fluidextract of yerba santa	1 ounce.
Glycerin	4 ounces.
Boiling water.....	enough.

Mix the chocolate and sugar with enough boiling water to make 2 pints. Allow the syrup to cool and then add the other ingredients.

To a syrup so made quinine or any of its salts may be added in the proportion desired.

Converting Degrees from Fahrenheit to Centigrade.—C. H. Stocking, Michigan, has found the following rule easy to apply: F—32 is to 180 as C. is to 100. For example, $92^\circ F =$ how many degrees C.? $92 - 32 = 60$, and $60 : 180 :: 33\frac{1}{3} : 100$; therefore $92^\circ F. = 33\frac{1}{3}^\circ C.$

This rule, it seems to us, is not so easy as the one we use, which is: To convert degrees Fahrenheit into degrees centigrade, subtract 32, divide by 9, multiply by 5. For example, take $212^\circ F.$, subtract 32, and we have 180; into this 9 goes 20 times; and 5 times 20 is 100. To convert degrees centigrade into degrees Fahrenheit, divide by 5, multiply by 9, and add 32. It is easy to remember these rules, because we know that the boiling point is 212° on one scale and 100° on the other, and those two figures suggest the application of the rules to themselves, and that enables us to remember the factors to apply to any other given figures.

How to Secure a Serial Number.—F. A. K., New York.—Apply to the secretary of agriculture, Washington, D. C.

Although the food and drugs act of June 30th, 1906, is over five years old, much misapprehension seems to exist about some of its simplest phases. The law does not apply to goods manufactured and sold entirely within any one State. When it does apply it does not require any guaranty, or require any serial number in case such guaranty is voluntarily given. The purpose of the guaranty is to shift responsibility for any adulteration or misbranding under the act from the shoulders of the dealer to those of the firm which gives the guaranty, and the latter may be in the form of a letter, or be attached to the invoice of the goods, or be in some other shape.

To save trouble for the manufacturer, wholesaler and retailer, and to make it easy to establish the fact that a guaranty was given, and by whom, as to the legality of any particular package of goods, the serial-number plan was put into operation by the three cabinet officers whose business it is to administer the law. The plan is this: Instead of sending a written or printed guaranty with each lot of goods sold, the manufacturer or wholesaler is permitted to file a general guaranty with the secretary of agriculture, which guaranty is kept on file under a certain number, and any package of goods to which this number is attached by the guarantor, together with the usual legend, "Guaranteed by ——— under the food and drugs act, June 30th, 1906," is as fully guaranteed as if a written guaranty, signed by the concern giving it, were pasted on the container.

In applying to the secretary of agriculture for a serial number, the manufacturer, wholesaler or other dealer wishing to give the guaranty, should file some such statement as this, signed in ink:

I (we) the undersigned do hereby guarantee that the articles of foods or drugs manufactured, packed, distributed, or sold by me (us) [specifying the same as fully as possible] are not adulterated or misbranded within the meaning of the food and drugs act, June 30th, 1906.

Failure to have given such a guaranty is no defense for the manufacturer in case his goods are found to be adulterated or misbranded; but the presence of a manufacturer's guaranty is a defense for the dealer who innocently sells adulterated or misbranded goods.

Saturated Solutions.—I. Mishkin, New York, referring to the note on the "Mathematics of Solution" in the CIRCULAR for October, page 569, writes:

Most druggists dispense 1 ounce (by measure) of a saturated solution of KI, whenever 1 ounce of saturated solution is prescribed, whereas solutions as a rule are made by weight; so in this instance the same rule of three will show the exact amount of KI necessary to make 1 ounce of saturated solution; $1.7:1::456.7=268.64$ grains of KI and water q. s. to make 1 ounce by weight will make a saturated solution.

Don't you think it is perfectly legitimate to dispense 1 ounce by weight, when the physician orders 1 ounce of a saturated solution of KI?

We are not quite able to follow Friend Mishkin's figures. In the first place, in answer to his query, we do not think that American physicians, as a rule, expect to receive an ounce by weight when they ask for an ounce of a liquid. But supposing that a physician, or anybody else, specified that he wanted an ounce by weight of a saturated solution of potassium iodide, would he expect 456.7 grains to be dispensed? An ounce by measure of water weighs 454.6 grains, and an apothecaries' ounce by weight of water (or anything else) is 480 grains, so the factor 456.7 seems irrelevant, whether we are discussing measured ounces or weighed ounces. We do not know where our correspondent picked it up. A grain of potassium iodide and 0.7 grain of water make a saturated solution weighing 1.7 grains. Now, if an apothecaries' ounce by weight of such a solution is wanted, the rule of three is applied and we have: $1.7:480::1:282.35$ (which is the number of grains of potassium iodide required, with water enough to weigh 480 grains); or, $1.7:480::0.7:197.65$ (which is the number of grains of water required, with potassium iodide enough to make 480 grains). By way of proof we may add the indicated weight of potassium iodide (282.35 grains) to the indicated weight of water (197.65 grains) and get the weight of 1 ounce of the saturated solution (480 grains).

Another reader, who does not care to come into the limelight and receive his meed, writes:

Allow me to say that one troy ounce of potassium iodide dissolved in $5\frac{1}{2}$ drams of water will make a fluid ounce of a saturated solution. This is "rule of thumb"—not figured. I don't know of any method by which it can be figured.

Analgesic Balm Bengué.—E. C. C., Iowa.—In more than one former issue of the CIRCULAR is given the formula below, from *Formulaire de préparations pharmaceutiques de la Société de Pharmacie d'Anvers*:

Baume de Menthol Composé.

(Baume Analgesique Bengué.)

Lanolin	45 grammes.
Yellow wax.....	10 grammes.
Distilled water.....	15 grammes.
Menthol	15 grammes.
Methyl salicylate.....	15 grammes.

Antimalarial Tonic.—D. C. B., Mississippi.—We do not know the composition of the proprietary article you name. We have never seen a sample of it, but suspect, from your description that it is some kind of a cinchona preparation. Of formulas for syrups and elixirs of various salts of quinine, as well as of some of the other alkaloids of the cinchona bark, there is no dearth.

Cuticura Resolvent, and Munyon's Remedies.—Howard W. Gardner, Pennsylvania, writes in further answer to the query of C. S., Mississippi, in the CIRCULAR for October, page 573, that an analysis of cuticura resolvent has been published by the British Medical Association and reprinted in a book entitled *Nos-trums and Quackery*, by the American Medical Association. He also says that every druggist should have a copy of this book, as it costs only \$1 and contains exposés of many medical frauds. He mentions the fact that the book says that *Munyon's kidney pills*, so far as chemical analysis reveals, contain only sugar—that and nothing more.

In the CIRCULAR for last January, page 45, is an account of the imposing of a fine of \$600 on Dr. Munyon by the United States district court at Philadelphia, as a result of his plea of guilty to the three charges that his "special liquid blood cure," his "blood cure," and his "asthma cure" were misbranded under the food and drugs act. Chemists testified at that time that certain of these "cures" consisted of nothing but sugar. In the CIRCULAR for the following month, page 104, Dr. Munyon explained that if his remedies have no remedial value the trouble is with Hahnemann's system.

We have often urged druggists to secure the publications on "patent" medicines issued by the American Medical Association, Chicago. In the CIRCULAR for January, 1910, page 10, is an article in which are given extended citations from the publication of the British Medical Association (*Secret Remedies, What they Cost and What they Contain*) to which our correspondent refers. We thank him for his interest.

Incidentally, Mr. Gardner, who is a young man and a clerk, seems to be of the right sort, for he looks forward to the time when deceiving the sick by false representations as to the curative properties of medicines will be punished by sending the guilty to prison. It is encouraging to those who believe in truth and honor in medicine as in other things to see that young men are now growing up under auspices which cause them to take views of the nostrum evil radically different from those widely held a generation ago.

Betul-ol.—E. C. C., Iowa.—We do not know the composition of this preparation. Its principal ingredient is said to be oil of *betula lenta* (sweet birch). On the label of the bottle it is described as being "mentho-methyl-oleo-salicylate chemically combined with 2 per cent. of chloral." It is also stated to be a 2 per cent. solution of menthol in a methyl ester of the salicylic radical.

Canthrox.—W. L. W., Ohio.—We have not seen any statement of the composition of this "prescription nostrum." For a "powder that will dissolve in water and one that will lather for shampoo" we offer the following formula:

Ammonium carbonate, powdered....	2 ounces.
Sodium carbonate, dried.....	8 ounces.
Saponin, crude.....	1 ounce.
Borax, powdered.....	5 ounces.

Mix intimately in a warm mortar; put up in paraffined or parchment paper.

Formulas for other foaming shampoo powders appear in the issues of the CIRCULAR for November, 1910, page 575; and September of the same year, page 468; and in many earlier ones as well.

Ordinary Capsules for Liquids.—George H. Waltz, Maryland, who writes as if he were a young man who makes some use of his powers of observation, and is certainly one who has the right idea about reducing to manuscript some of the things he observes and passing it along for the benefit of others, favors us with the following:

Since it is not a daily occurrence to have prescriptions calling for liquids or semi-liquids to be dispensed in capsules, it hardly justifies the average retail druggist to stock empty soluble elastic capsules, especially as the ordinary gelatin capsule may be used to equally good advantage in many instances.

Experience has shown how the following method can be employed satisfactorily: The required amount of medicament to be used for each dose is put into the larger portion of the empty capsule after the removal of the cap, then the edge at the opening of that portion containing the medicament is moistened with water, and before it has time to dry the cap is put on and the capsule is pressed between the thumb and index finger in such a way that the edge of the larger portion of the capsule at the line of contact with the curved part of the cap forms a scalloped edge which indicates a welding or cementing. To make sure that the capsule is tightly sealed the operator should lay each finished capsule on a filter paper and watch for any leakage. It is advisable to fill more than the required number of capsules, as there may be among them some failures.

Should the operator not feel sure that the capsules are thoroughly sealed and fears that a future leakage may appear, it is quite practical for him to put the finished capsule in an empty capsule of a larger size and seal the outer one just as the inner one had been sealed.

A little experimentation will show which make of capsules possesses in greatest degree two desiderata, elasticity and resistance.

A warning which we may add to the foregoing is that druggists should be sure that the liquid dispensed as directed by our correspondent will not dissolve the capsule. A note in which this feature of the case is mentioned appears in the CIRCULAR for January, page 79.

We thank Mr. Waltz for his manifestation of the give-and-take spirit which we wish to pervade this department, and trust that not only will he let us hear from him again, but that his example will prove an inspiration and an impetus to others.

Liquid Metal Polish.—C. C. C., Ohio, wants a formula for a metal polish. He says he has found a number of them in the issues of the CIRCULAR for last February, "but none for high polish metals." He adds: "There seems to be a number of very good polishes on the market, but none of them will retain their brilliancy over twenty-four hours."

We fail to find the formulas in our February issue to which our querist refers, but in the May number, page 256, we find a note on the subject which gives many references to previous issues in which such data appear, as well as a formula for an oleic acid and kieselguhr combination. A polish of a different type has the following formula:

Sodium hydroxide.....	2 drams.
Gilder's whiting.....	2 ounces.
Infusorial earth.....	3 ounces.
Solution of sodium silicate.....	1 pint.

Other notes on and formulas for such preparations have since been given in the issues for June, page 308; September, page 491; and November, page 634. As the last-mentioned number contains the kind of formulas which our querist seems to desire, and as

this had not reached him when he wrote, but has since doubtless done so, we may now consider that this portion of his query has been answered.

We presume that it is the article to which it has been applied and not, as he has it, the polish itself, which C. C. C. desires to remain brilliant. If this is the case we fear we shall be able to give him but little aid, as the loss of brilliance of a polished metal surface is usually due to oxygenation or some other chemical change brought about by an element in the atmosphere. Where its application is practicable it is customary to prevent, or at least retard, this change by coating the polished article with lacquer or a solution of collodion.

Chewing Gum.—C. F. F., California.—In addition to the many notes on this subject, with formulas, which appear in the files of the CIRCULAR, reference to some of which appears in the number for September, page 480, there is a reprint from a British journal in last month's issue, page 649, which gives some information on it. However, it can not be too strongly emphasized, that equipment is the prime requisite in the manufacture of chewing gum, not a formula.

Sulphuretted Hydrogen in Bitter Water.—J. J. H., New York asks: "If a water, such as the Hungarian bitter water, has an odor and taste of sulphuretted hydrogen, does that show decomposition?"

We referred this question to a pharmaceutical chemist of wide practical experience, and to a large importer of Hungarian bitter water, and they agree that the presence of sulphuretted hydrogen in such water does not necessarily indicate that it is "spoiled." The importer said that in an experience of fifteen years, during which time he had handled thousands of cases of this water, he had known of less than a dozen instances in which the presence of the objectionable gas was manifest, and in these instances the gas passed away when the stopper was left out of the bottle for a short while.

In a paper read before the Pennsylvania Pharmaceutical Association at its meeting held last June, F. M. Apple told how he had noticed hydrogen sulphide (as he more properly calls the malodorous gas) in samples of mineral water, and how he had got rid of it by emptying the water into an open vessel and then pouring it back and forth from one vessel to another until it was free of the odor. He seemed to think that the water was as good as ever after this treatment.

What Is "Ars. Sol. Pep."?—M. S. B., Alabama, sends us a prescription which reads as follows:

R	Strych. sulph.....	gr. ¾.
	Glycerophos. co.....	3 vj.
	Tr. gent. co.....	3 ij.
	Liq. taka diastase.....	3 ij.
	Ars. sol. pep.....	q. s. ad. 3 x ij.

M.

"I am unable to find out what the last preparation is," writes our querist, and asks our aid.

We should like to have the help of all our readers in this matter. We have sent one guess to M. S. B. and have another in reserve. What do our readers say?

Baking Powder.—W. L. W., Ohio.—Some years ago a United States government expert after examining the baking powders on the market and conducting an elaborate series of experiments of a practical as well as of a theoretical nature, published the conclusion that a baking powder composed of two certain simple ingredients, properly adjusted as to proportion, gave the best results chemically, hygienically and in actual practice. These ingredients and proportions are potassium bitartrate, 2 parts, and sodium bicarbonate, 1 part. For "body" he recommended the use of corn starch, 1 part. In making the powder each ingredient should be dried separately; and the whole should then be thoroughly mixed and kept in well-closed containers.

While there are numerous formulas for baking powders in which all sorts of things in all sorts of proportions are given, the natural inference is that any other proportions of the two active ingredients mentioned would leave an unnecessary quantity of undesirable residue, and that other active ingredients would be useless if they did not prove even harmful.

It has recently been claimed that the addition of dried milk as a part of the body improves the dietetic properties of the products into which the powder enters. The addition of this substance is the subject of one or more letters patent in Europe.

Selling Opium to Chinamen.—"An Old Subscriber," South Dakota, asks: "Is there any law (United States) prohibiting the sale of gum opium in quantities to Chinamen? You will greatly oblige me by giving an authoritative answer, as no one around here seems to be able to do so."

The question was passed along to the treasury department at Washington, and F. M. Halstead, chief of the division of customs of that department, has replied as follows:

In reply to your letter of the 11th instant I have to state that there is no United States law prohibiting the selling of gum opium or any kind of opium to Chinamen.

The act of February 23d, 1887 (24 Stat. 409) prohibits the importation of opium into any of the ports of the United States by any subject of the emperor of China.

The act of February 9th, 1909, prohibits the importation of smoking opium absolutely and the importation of any other forms of opium except for medicinal purposes.

Section 36 of the act of October 1st, 1890 (26 Stat. 620), provides that no person shall engage in the manufacture of opium for smoking purposes who is not a citizen of the United States, and who has not given the bond required by the commissioner of internal revenue.

This seems to cover the point and is authoritative.

Liquid Court Plaster.—A. L. C., Illinois.—We are unable to tell you how the proprietary preparation which you name is made, but may say that many notes on similar articles, with formulas, appear in previous numbers of the CIRCULAR. From one in the issue for September, 1909, page 454, is reproduced the formula below:

Pyroxylin	1 ounce.
Amyl acetate.....	5 ounces.
Acetone	15 ounces.
Balsam of fir.....	2 drams.
Castor oil.....	2 drams.
Oil of cloves.....	15 minims.

Dissolve the pyroxylin in the amyl acetate and the acetone, and add the other ingredients, avoiding fire or light.

Scarlet Red Ointment.—P. P., District of Columbia.—About five years ago, Fischer called the attention of the medical profession to the favorable action of Biebrich scarlet red (amidoazotoluol-azo-betanaphthol) on the growth of epithelium; and, this quality of the substance having been subsequently attested by numerous experimenters, the dye has come into considerable use in the treatment of wounds.

In a note on the therapy of scarlet red in the CIRCULAR for December, 1909, page 635, appears the following quotation from the *Prescriber*:

Scarlet red is used in the form of an ointment, 4 to 8 per cent. in soft paraffin or in a mixture of that base with lanolin. It may also be applied suspended in olive oil, but the ointment is preferable. When applied to ulcers, the ointment may be spread on gauze and covered by a bandage, the skin round the ulcer being covered with zinc ointment to avoid irritation. The gauze should not remain on the wound longer than twenty-four hours, the raw area being delicately cleaned before a fresh application. Should irritation occur, a dressing of boric acid ointment should be substituted for a day, after which a dressing of weaker scarlet red ointment may be applied.

McDonagh (*Lancet*) recommends an ointment made by dissolving 2 parts of scarlet red in chloroform and mixing with 25 parts of petrolatum. This is to be applied every third day, boric acid ointment being used on the intervening days.

In a recent issue of the *Prescriber* appears the following formula for a dusting powder recommended by Pavia (*Therap. der Gegenwart*) for use in instances where the ointment is unsuitable:

Scarlet Red Dusting Powder.

Scarlet red, medicinal..... 1 gramme.
Boric acid in fine powder..... 9 grammes.

The author directs that the wound be carefully dried with cotton; a thin layer of the powder applied by means of an insufflator; and the cavity loosely packed with gauze. The powder is applied at first every day, then at gradually increased intervals. It is reported that the results are more satisfactory than are those following the use of the ointment.

It is important that pharmacists know what this ointment is and how to prepare it; it is equally important that they leave the prescribing and application of it to physicians.

Chlorbutanol and Butyl-Chloral Hydrate.—"Subscriber," New Jersey, wants to be informed what is the "difference between chlorbutano and chlorbutyl." His names, it seems to us, are abbreviated not wisely but too much. As near as we can get at it, what he really wants to know is the difference between chlorbutanol and butyl-chloral hydrate. Modern *Materia Medica* contains the following note on the former:

Chlorbutanol (acetone-chloroform; trichlor-tertiary-butyl alcohol), $C_4H_7OCl_3$, is produced by the reaction of acetone on chloroform. It occurs as small, white, volatile crystals, of camphoraceous odor and taste, and soluble in alcohol, ether, chloroform, or glycerin, and sparingly soluble in water. It is employed as a local anesthetic, anodyne and nerve sedative, also as a preservative of medicamentous solutions. Dose, 5 to 20 grains. As a local anesthetic a concentrated aqueous solution is used. (See chlorotone, methaform [trade-names employed by American manufacturers].)

Butyl-chloral hydrate is fully described in the dispensaries. The respective chemical formulas for the two substances are, chlorbutanol, $C_4H_7OCl_3$ and butyl-chloral hydrate, $C_4H_5Cl_3O.H_2O$.

Beauty Cream. — "Doctor," Michigan. — We have no knowledge of the composition of the cream to which you refer. The purposes for which it is offered are accomplished by any of the further-developed modifications of Galen's cerate. The following formulas from the French of Dourville represent examples of this type:

Glycerin Cream.

Almond oil.....	500 grammes.
Glycerin	75 grammes.
White wax.....	30 grammes.
Marseilles soap.....	15 grammes.
Oil of thyme (perfumer's).....	5 grammes.
Oil of bergamot.....	5 grammes.
Oil of neroli.....	2 grammes.

Dissolve the soap in the glycerin; melt the wax in the almond oil; add the glycerin-soap solution and beat the mixture until a homogeneous cream is produced; then incorporate the perfuming oils.

Pearly Cold Cream.

Almond oil.....	1000 grammes.
White wax.....	60 grammes.
Spermaceti	100 grammes.
Castor oil.....	10 grammes.
Rose water.....	300 grammes.
Oil of bergamot.....	10 grammes.
Oil of rose.....	2 grammes.
Oil of geranium.....	2 grammes.

Melt the wax and the spermaceti over a water-bath; add the almond oil all at once; when the mixture is clear, remove the container from the heat. Add the castor oil; then the rose water, beating thoroughly the while. When cool incorporate the perfume. If desired a trace of methyl violet may be added to improve the tint of the finished product.

Lanolin Cream.

Lanolin	500 grammes.
Almond oil.....	500 grammes.
White wax.....	100 grammes.
Rose water.....	500 grammes.
Vanillin	15 grammes.
Terpineol	10 grammes.

Combine these in a manner similar to that directed for either of the preceding formulas.

Making Shot for Guns.—D. K., New York.—Something more than a formula is necessary in "preparing gun shot" and "hardening the lead." The metal used for ordinary drop shot is an alloy of lead and arsenic, sometimes containing tin. About 3 pounds of crude arsenous acid or yellow arsenic sulphide is the usual proportion to half a ton of soft lead. Coarser varieties of lead require a larger proportion of arsenic up to 16 pounds to the ton. The proper proportion is determined by the appearance of the pellets. If these are lens-shaped, the proportion of arsenic is too great. If they are lop-sided, "cupped," or tear-shaped with more or less of a tail, the alloy contains too little arsenic. Tailed pellets are characteristic of alloys containing too much tin.

To form the shot pellets the molten metal is dropped from cullenders at the top of a shot-tower, usually more than a hundred feet high, into a vat of water at the base of the tower. The height of the tower influences the size of the shot. The cooler the air in the tower the better the grade of shot. Not

only do the harder varieties contain tin, but some of the larger sizes of shot are made from a more complex alloy.

The differences in the various methods of shot-making are matters of alloy, cullender lining, cullender heating, air supply, and finishing mills. The processes are outlined in the encyclopedias; and Ure's Dictionary of Arts, Manufactures and Mines, has an instructive monograph on the subject. Its connection with pharmacy, if it has any, is so slight that we do not feel justified in devoting any more space to the subject here.

Degrees Baumé.—"Subscriber," Virginia, requests that we "explain what is meant by '26° B. at 15° C.' found on the labels of 28 per cent. ammonia water." "B" stands for Baumé and "C" for centigrade. The temperature at which specific gravity is taken is, with chemists, 15° C., the official temperature in most countries. In this country the official temperature for taking specific gravity was changed in the eighth revision of the Pharmacopœia to 25° C., as stated on page liii of that book. An easy and much used method of taking the specific gravity of liquids is by using Baumé's hydrometer. By dropping this instrument into a liquid it sinks to a depth which varies with the weight of the liquid. A scale indicates the depth the instrument sinks, and by a simple computation the figure, or degree, on the scale may be made to show the specific gravity. The following is the rule when the hydrometer for liquids lighter than water is used: Divide 140 by 130 + the degree B. Applying this rule to the present case we

have $\frac{140}{130 + 26}$, the answer being 0.897, which is the specific gravity of stronger ammonia water.

All of which is explained in any work on pharmacy.

Coloring with Cudbear.—J. C. Dills, Drug Clerk, Wisconsin, writes that he has found that when tincture of cudbear is added to any one of a number of preparations, a sickly red color is imparted, unless more of the tincture than is allowable is used. He goes on to say:

This can be gotten around by adding the amount of powdered cudbear that would properly represent the required amount of the tincture to the preparation direct. This is particularly true in "alkaline antiseptic," and compound digestive elixir. Further, regarding these two preparations, I may say that we never use any talcum or other filtering powder in making them, having never found them necessary: after standing a couple of days either will filter through the ordinary filter paper brilliantly clear.

I was interested in Otto Raubenheimer's article on persinon, in the CIRCULAR for September, page 515. I have found that a cudbear color to be of the proper tint and to be stable must be made by using a menstruum as near the finished product as possible, since, the coloring matter (therein called persinon) seems to be very complex. We have made up several cudbear solutions in different mediums and have found that one made with a weak alcohol content will not satisfactorily color a strongly alcoholic liquor, and vice versa.

The latter point seems to be especially valuable, and may be the one whereon hangs the failure of many operators to get uniformly good results from the use of tincture of cudbear. We thank Mr. Dills for his note and invite him to "come again."

"After-Shave."—W. B., Ohio, finds that he cannot get a clear preparation with the following formula, which, the owner declares, represents a mixture that is not cloudy:

Extract of violet.....	1 ounce.
Menthol	40 grains.
Cologne spirit.....	2 pints.
Solution of irish moss enough to make	1 gallon.

Assuming, for the sake of convenience, that solution of irish moss is the equivalent of mucilage of irish moss N. F., and that this preparation has been clarified by filtering through cotton-flannel, we should attribute the cloudiness to two causes: First, the addition of the ordinary extract of violet containing about 70 per cent. of alcohol to a liquid weaker in alcoholic content will result in cloudiness due to the aromatic fatty bodies being thrown out of solution; and, second, any preparation of irish moss containing no other preservative than 25 per cent. of alcohol is quite liable to deteriorate rapidly through fermentation.

To remedy the trouble, we suggest the use of about 1 per cent. each of boric acid and benzoic acid in the water used in preparing the solution (or mucilage) of irish moss, and the use of a perfume adapted to hydro-alcoholic liquids of the nature of the foregoing. Another suggestion: Add the alcoholic liquid slowly and with a minimum of agitation, as air bubbles are difficult to disperse once they have formed. In passing we might remark that we have never seen a gum-containing after-shave lotion that was perfectly clear.

A good formula for one of these useful and popular lotions is given in the CIRCULAR for October, 1910, page 518.

Massage Cream.—S. G., Michigan.—The cream to which you refer is a good example of the casein rolling creams, a typical formula for which appears on page 640 of last month's CIRCULAR. We believe that the best results are obtained with casein freshly prepared by the magnesium-sulphate-and-alum method which was described in detail in an article by Dr. Mary Emma Doyle in the CIRCULAR for June, 1907, page 405.

It is evident that, to secure the appearance of the high-priced finished product of the experienced manufacturer, it is necessary that the manipulator possess considerable special skill, and that the quality of the ingredients is not secondary to the cost.

In the CIRCULAR for January, 1910, several pages were devoted to an article on the manufacture of modern skin creams.

Solution of Artificial Musk.—H. D., Pennsylvania.—It is said that the odor of a solution of artificial musk can be enhanced by the addition of about 5 drops of ammonia water to a pint of the 1 per cent. solution. These solutions are usually made with cologne spirit.

We are inclined to the opinion that much of your trouble is due to a confusion of the several substances known as artificial musk. The best known of these is probably the "musk Baur" to which you refer. This is a nitration product of toluol or xylol. Chemically "musk Baur" has several forms, trinitrobutyltoluol and trinitrobutylxylol being the chief ones. These, it is said, are inferior in odorous value to the

ketone musks, dinitro derivatives of the methyl, butyryl or valeryl ketones of butyltoluol or butylxylol. For perfuming hydro-alcoholic liquids and soaps the artificial musk which is chemically dinitrobutylxylol-bromide is especially mentioned by Dourville. The 1 per cent. alcoholic solution of this substance has but a faint odor, but this is increased by dilution with water. Tonquinol is the trade-name of another variety of artificial musk first manufactured by Valentinér. A British patent covers an artificial musk which is a sulphonation product of several terpenes, oil of eucalyptus and oil of amber.

Sometimes a lack of perfuming strength is an indication that the artificial musk has been sophisticated with acetanilide, such sophistication being a rather common practice.

Bismuth Subnitrate in an Acid Mixture.—"Salol," Rhode Island, submits the following example of troublesome prescriptions:

R	Bis. subnit.....	5j.
	Ess. pepsin, N. F.....	5ij.
	Lloyd's hydrastis.....	5i.
	Aq. menth. pip.....	q.s. ad 5iv.

He complains that the mixture has been returned "on account of the bismuth sticking to the sides of the bottle, no amount of shaking seeming to release it." He says that the addition of glycerin has been of no avail.

The trouble is characteristic of bismuth salts in acid mixtures, and can not be obviated except by changing the medium in which the bismuth is suspended. In the present instance this would mean the omission of the essence of pepsin and the liquid hydrastis, both being acid in reaction—to neutralize them would be to invite greater trouble. It is well to point out to physicians that bismuth salts with acids form cement-like deposits, which can not be obviated even by the use of acacia or other suspending agent. The only solution of the problem of dispensing pepsin in liquid form and bismuth at the same time is to exhibit the bismuth salt separately in powders or cachets; the so-called elixirs of bismuth and pepsin have little if any of the therapeutic value of these two ingredients.

Stainless Iodine Ointment.—W. M. Linnett, Jr., New Jersey, contributes the following note on the aforementioned preparation:

Some time ago in an issue of your paper [July, 1910, page 363] a subscriber asked you for the formula for stainless iodine ointment. This party being in New Jersey, no doubt had reference to a certain stainless iodine ointment made in this State. I myself have wanted a formula for this same ointment, so I set to thinking, and the result was as follows:

I found that making a 5 per cent. ointment of iodine with 5 per cent. of lanum, 15 per cent. of petrox N. F., 10 per cent. of a thick starch paste, and the balance to 100 per cent. (or 70 per cent.) of petrolatum, yellow, gave us just about what we wanted in the line of a stainless iodine ointment.

Mr. Linnett's thinking habit is a good as well as profitable one, and one worthy of the emulation of all pharmaceutical practitioners. His other habit, that of giving his fellow-pharmacists the benefit of his thinking is equally commendable. We find pleasure in acknowledging our gratitude to Mr. Linnett, and feel sure that this acknowledgement finds an echo in the minds of many of our readers.

White Cream Liniment Powder.—C. F. J., Minnesota.—If we were looking for something in powder form "to be added to [oil of] turpentine, etc." we should assume that the "etc." meant at least water and perhaps vinegar and maybe camphor and possibly an egg or two. Then we should powder some animal-oil soap and some ammonium carbonate. Next we should make a saturated solution of sodium hydroxide in alcohol, adding enough of the powdered soap to this solution to make a fairly stiff paste; granulate this paste through a sieve, dry the granules thoroughly, mix them well with the powdered ammonium carbonate, and reduce the batch to powder. Which powder we believe would make something of a cream with "turpentine" and water, and a real custardy cream with the help of an egg or two.

Had we less time for preparation we might satisfy ourselves and the liniment maker with powdered alkaline soap.

Refilling Prescriptions for Morphine or Cocaine.—M. G., New York.—The fifth paragraph of section 238, article 11, chapter 422 of the laws of this State, reads as follows:

Prescriptions of opium, morphine and chloral. No pharmacist, druggist, or other person shall refill more than once, prescriptions containing opium or morphine or preparations of either of them or chloral, in which the dose of opium shall exceed one-quarter of a grain, or of morphine one-twentieth of a grain, or of chloral ten grains, except upon the written order of a physician.

The language of section 1745 of the penal law of this State, popularly known as the "penal code," is as follows:

Regulations as to prescriptions of opium and morphine. A person who, except on the written or verbal order of a physician, refills more than once prescriptions containing opium, morphine or preparations of either, in which the dose of opium exceeds one-fourth grain, or morphine one-twentieth grain, is guilty of a misdemeanor.

In this city there has been no legal restriction upon the refilling of prescriptions containing less than one-twentieth of a grain of morphine to the dose, since section 182 of the sanitary code of the municipal board of health was amended by deleting the words "Any such prescription shall not be refilled."

Section 1746 of the penal law begins with the following statement:

Sale of cocaine or eucaïne. It shall be unlawful for any person to sell, furnish or dispose of alkaloid cocaine or its salts, or alpha or beta eucaïne or their salts or any admixture of cocaine or eucaïne; except upon the written prescription of a duly registered physician, which prescription shall be retained by the person who dispenses the same, shall be filled but once and of which no copy shall be taken by any person. . . .

Further on, this same paragraph is continued in the following language:

Any person who sells, furnishes or disposes of alkaloid cocaine or its salts, or alpha or beta eucaïne or their salts or any admixture of cocaine or eucaïne, upon the written prescription of a duly registered physician, as authorized by this section, shall, at the time of dispensing the same, give to the person to whom the same is sold or furnished a certificate stating the name and address of the person selling or furnishing such drug or mixture, the name and address of the physician upon whose prescription the same is sold or furnished, the date of sale and the amount sold. . . .

Section 182 of the sanitary code of the municipal board of health has nothing whatever to do with prescriptions for cocaine.

The intent of the law is quite clear: No prescrip-

tion for cocaine may legally be refilled, nor can a copy of the written prescription be given to any person. No prescription containing more than one-twentieth of a grain of morphine in each specified dose can legally be refilled more than once.

Your query as to how many repetitions of a cocaine prescription are covered by the certificate given to the presenter of the original prescription is superfluous as there can legally be no repetitions; each written order from the prescriber to refill the original prescription must be treated as an original prescription and calls for a new certificate.

Tooth Wash with Green Soap.—"Hospital," New York.—As a base for your preparation we suggest the following:

Green soap.....	50 grammes.
Glycerin	100 c.c. (mils).
Alcohol U. S. P.....	500 c.c. (mils).
Distilled water, enough to make	1000 c.c. (mils).
Solution of carmine.....	enough to color.

We hesitate to suggest a "more delicate flavor" than the blend of oil of gaultheria, oil of cassia, and oil of peppermint which you mention, because of the influence of the personal equation upon the interpretation of "delicate flavor." For your guidance in experimentation, however, we offer the following which at least have the advantage of being different. (The quantities are not intended to be the proper ones for 1000 c.c. [mils] of the base):

I.	
Oil of spearmint.....	50 grammes.
Oil of star anise.....	30 grammes.
Oil of Ceylon cinnamon.....	2 grammes.
Oil of cloves.....	5 grammes.
Oil of bergamot.....	2 grammes.

II.	
Oil of cloves.....	55 grammes.
Oil of star anise.....	47 grammes.
Oil of spearmint.....	40 grammes.
Oil of citronella.....	8 grammes.

III.	
Oil of spearmint.....	4 grammes.
Oil of cloves.....	1 gramme.
Oil of Russian anise.....	1 gramme.
Oil of Ceylon cinnamon.....	1 gramme.
Oil of rose.....	20 grammes.
Oil of orange.....	2 grammes.

IV.	
Oil of rose.....	1 gramme.
Oil of angelica.....	1 gramme.
Oil of orris.....	3 grammes.
Tincture of vanilla.....	10 grammes.

V.	
Oil of rose.....	6 grammes.
Oil of neroli.....	4 grammes.
Oil of citron.....	2 grammes.
Oil of cinnamon.....	2 grammes.
Oil of cloves.....	2 grammes.
Oil of lavender.....	1 gramme.
Oil of pimento.....	1 gramme.

Physiological Salt Solution.—We have received a note on this subject signed "Druggist, N. Y. C." If our modest friend will favor us with his name and address (for our own guidance only, not necessarily for publication), we shall be glad to consider his communication with a view to its publication.

Preparing Sulphamido-Benzoi Acid.—M. L., New York, writes: "Kindly let me know how to make the substance 'Amid sulphin benzoic Acid,' I mean the amid which is used to produce benzoic sulphin."

By exercising our well-developed guessing faculty we have concluded that our correspondent desires some information anent the production of sulphamido-benzoic acid the parent product of benzosulphinide U. S. P., more commonly known as saccharin. In the British Pharmaceutical Codex saccharin is called gluside, and the manner of preparing it is described as follows:

Gluside, $C_6H_4COSO_2NH_2$, may be prepared by treating toluene with concentrated sulphuric acid at 100° , thus forming ortho- and para-toluenesulphonic acids, $C_6H_4(CH_3)SO_3H_2$. The acids are converted into the calcium salts, and these in turn into sodium salts; the latter, by the action of phosphorus pentachloride, yield a mixture of ortho- and para-toluenesulpho-chlorides, from which, on cooling, the para-salt is got rid of by crystallization. The ortho-compound is then treated with dry ammonia gas, whereby ortho-toluene sulphamide, $C_6H_4(CH_3)SO_2NH_2$, is formed. This is next oxidized with potassium permanganate, and the resulting potassium compound decomposed by means of an acid; orthosulphamido-benzoic acid is thus formed, but splits up into its anhydride, gluside, and water.

In Noyes' Organic Chemistry for the Laboratory, second edition, the preparation of saccharin is described in detail in the paragraph on "The Preparation of Sulphone-chlorides and Sulphonamides by the Use of Chloride of Sulphuric Acid." The subject is treated more or less at length in all recent text-books on organic chemistry.

We are of the opinion that the practicable methods of producing benzosulphinide are covered by letters patent. Should our correspondent be interested, we can inform him of the whereabouts of a manufactory equipped with formulas, processes, and apparatus for the production of benzosulphinide that may be purchased quite reasonably because of the growing opposition to the use of synthetic substitutes for sugar in foodstuffs.

Cleaning Powder.—F. M. C., Pennsylvania.—We do not know the composition of the brand of cleaning powder you mention, and we think the general interest in the matter would not justify us in going to the expense of making an analysis of it, especially as formulas for many cleaning powders are already well known. We call your attention to notes on this subject, with formulas, in the issues of the CIRCULAR for January, page 30; November, 1909, page 589; and March, 1907, page 270. In the issue for April, 1907, page 306, is a note on a cheap cleaning powder free from grease, lime or caustic, sold in the West for 2 or 3 cents a pound. This powder is a sodium sesquicarbonate, known as "snow flake crystals," and is said to be worth twice as much as sal soda for cleaning purposes.

Paste Shoe Dressing.—D. R. P., Pennsylvania.—We are unable to tell you just how any given manufacturer makes his shoe polish, but you may find some formulas for preparations of this kind elsewhere in this number (page 696). Directions for making various kinds of shoe dressings appear in previous issues of the CIRCULAR. We refer you especially to those for March of this year, page 141, and for July, page 366, and September, page 468, both for 1910.

Several Formulas.—Our old friend Scott, of New York, who has favored us on a number of previous occasions, now makes good his reputation for ability to rise to the occasion, by sending the following notes:

Green Color for Show Globes.

In the October CIRCULAR, page 570, there is a request for a green color for show bottles.

One may make a very satisfactory green—pretty and permanent—as follows: Put three or four one-cent coins in the bottom of a graduate, pour on a little nitric acid to cover well and set in the open air to allow the fumes to escape. When solution is effected dilute it with enough water to fill the bottle.

Yellow or Orange Globe Colors.

Solution of potassium dichromate according to its strength makes a good yellow or orange color.

Christmas Specialty.

By the way, Christmas is almost here—just the time for sachet powders. Here are formulas for two powders that are very choice and can be sold at from 25 to 40 cents an ounce, at which prices they afford a "get-rich-quick" profit. They compare most favorably with those costing \$2 or more per pound:

Carnation Sachet Powder.

Oil of cloves.....	2 fl. drs.
Granulated orris root.....	1 lb. av.
Oil of sandalwood.....	10 minims.
Solution of carmine or Tincture of cudbear.....	enough.
Alcohol	½ fl. oz.

Put half the orris root in a mortar and pour on enough of the solution of carmine or tincture of cudbear to give a dark-pink or light-red color, then mix the remaining orris root with it. Dissolve the oils in the alcohol and add to the colored orris root, a little at a time, mixing well after each addition. Set aside in well-stoppered bottles for two or three days. Then spread out on glass to dry spontaneously.

Heliotrope Sachet Powder.

Granulated orris root.....	1 lb. av.
Cumarin	1 dram.
Oil of sandalwood.....	15 minims.
Solution of carmine or Tincture of cudbear.....	enough.
Solution of anilin blue.....	enough.
Alcohol	½ fl. oz.

Color half the orris root a light-pink with the solution of carmine or tincture of cudbear. Color the other half a light-blue. Scent with the cumarin and oil of sandalwood dissolved in alcohol, and finish as directed above.

Other formulas will suggest themselves to those who study these. For instance, to make a violet powder, color one half the orris root dark-red and the other half dark-blue and use a good violet odor; to make a rose powder color as for heliotrope, and use ⅓ to ½ of carnation.

Now and then we receive a letter from a grateful subscriber who says that one formula found in the CIRCULAR has profited him more than the price of several years' subscription. Now, then, here's an opportunity for something of the kind.

Phenol Gangrene.—Dr. J. I. Wallach, New York, having read with interest the notes on this subject which have appeared in recent numbers of the CIRCULAR, is kind enough to contribute this report of a case:

The patient, D. C., a man thirty-four years old, received a superficial wound of the thumb due to injury with a screw driver. He went to a druggist, who applied a 3 per cent. solution of carbolic acid on a closed dressing. Eight days afterward, he came to the hospital for treatment. On admission, there was dry gangrene of the terminal phalanx. An amputation of the thumb was deemed necessary after other methods had failed.

We are pleased to hear from our house surgeon friend, and trust he will favor us again.

To Clean Wedgwood Mortars.—Mason G. Beebe, Vermont, believes in the give-and-take spirit in which we endeavor to conduct this department, so he writes:

In reading Mr. Ford's article in the November CIRCULAR, page 625, the paragraph in which he refers to dirty utensils struck me rather forcibly, as so few druggists give the matter of stained mortars a thought, evidently believing that washing with soap and water is sufficient, but if an analysis could be made it would show some surprising results. The porous nature of the wedgwood composition makes it difficult to clean, and even though there was no possible chance of contamination from it, the fact that a physician frequently sees a man using a mortar that looks as if it belonged in a blacksmith's shop does not cause a favorable impression, to say the least.

It has occurred to me that perhaps such as do not know of it already might appreciate the following inexpensive and simple method of treatment: Take 3 or 4 ounces of potassium dichromate, powder it fine, and add enough sulphuric acid to make a paste. Smear this over the mortar, inside and out, as well as on the pestle head, being careful not to get any of it on the wooden handle, and let it remain for fifteen minutes. After the mortar has stood a suitable time and been rinsed with cold water and then washed with soap and water, it will be as clean and white as when new. The same batch of paste may be used on many mortars.

While the above is not new or startling, a little application once a week or so will be fully as profitable as spending twice that amount of time wondering why business is so poor and why some of the doctors prefer dispensing to sending their prescriptions to the druggist. A little attention to small details of this nature instead of leaving them for the boy to look after is better than a good many dollars spent in useless kinds of advertising, because it is of itself an advertisement of cleanliness.

Suppose one druggist in each State contributed a note of this kind each month, that would be 46 such notes a month, or 552 notes a year—which, in the expressive language of the street, would be going some. We are grateful for each one received.

Stamping Ink.—Seeing the note on this subject in the CIRCULAR for last month, page 641, G. F. Dunbar, Massachusetts, writes:

A very satisfactory stamping ink may be made by grinding anilin colors with very thin colorless varnish, and reducing with oil of turpentine if necessary. I believe there is a concern in Philadelphia which makes a varnish expressly for this purpose.

Mr. Dunbar has our thanks for this manifestation of his spirit of reciprocity, and not only do we hope to hear from him again, but trust that his example may induce others who have good ideas to give them a wider circulation.

Menthol Pencils.—A. P., New York.—To form the menthol into proper shape, melt it and cast it in suitable molds. The menthol should be pure, as the presence of thymol spoils the pencil. When the molds are cold (ice may be used to cool them) the cones are removed and fastened to wooden holders with good glue. A note on this subject appears in the CIRCULAR for May, page 268.

Reciprocity between Boards of Pharmacy.—D. J., Texas.—In the CIRCULAR for January, page 31, is an extended note on this subject, to which reference has been made in this department at least twice—once in the CIRCULAR for March, page 138, and again in the issue for May, page 261. According to that note the boards of the following States (etc.), practice reciprocity with each other, with certain restrictions: Alabama, Arizona, Arkansas, Connecticut, District

of Columbia, Florida, Georgia, Idaho, Indiana, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Nevada, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Texas, Vermont, Virginia and West Virginia. The restrictions alluded to may be learned by writing to the secretary of the board of the State in which the candidate desires to become registered. The name and address of the secretary of each board of pharmacy in the United States appears in the CIRCULAR monthly.

To Prevent Waste at the Bung.—C. T. Heseltine, Maine, writes:

To pour liquids from the bungholes of barrels and kegs without spilling: use the wooden pieces that are supplied at each end of a roll of paper.

Little practical notes of this kind are always timely and welcome. In thanking Friend Heseltine for this one we take the occasion to solicit others.

Anonymous Queries.—"Alkaline Powder," New Jersey; "Ink Remover," Illinois.—Your attention is called to the standing notice at the head of this department in which it is stated that queries, to be answered by us, must be accompanied by the name and address of the writer. Not only do we keep that notice standing, but every once in a while we print a note similar to this one, calling special attention to it; and now and then we give our reasons for having made such a rule.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Universal Balm.—G. F. D., Massachusetts.

Mucol.—L. Y. L., Maine.

Tarola.—R. M. G., Maryland.

Atwood's Bitters.—M. B., New Jersey.

Browning Brass.

To produce a brown finish on brass, says *Metal Industry*, the surface is first sand-blasted, then washed thoroughly with a potassium cyanide dip, and rinsed with clear cold water. The article is then immersed in the following solution:

Potassium "sulphuret".....	2 ounces.
Barium "sulphuret".....	4 ounces.
Ammonia water.....	8 ounces.
Water	25 gallons.

As soon as the entire surface of the article presents a uniform gray appearance, the article should be transferred to the following solution:

Sulphuric acid.....	1 gallon.
Water	25 gallons.

When the color is of the required shade, the article is rinsed thoroughly in cold water then in hot water, dried in heated sawdust, brush polished, and lacquered with a satin-finish lacquer.

Witchhazel Glycerin Jelly.

Gelatin	1 ounce.
Glycerin	3 ounces.
Witchhazel water.....	20 ounces.

Mix, heat over a water bath, and add a perfume if desired.

Georgia Board Questions.

Herewith are reprinted the questions used by the Georgia Board of Pharmacy at an examination held November 6th, 1911. Other sets of questions asked by this board appear in the issues of the CIRCULAR for August, 1909, page 411; July, 1907, page 481; February, 1906, page 60; January, 1904, page 125; and December, 1901, page 251.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacy.

C. D. Jordan, Examiner.

1. (a) What is Lactic Acid? (b) What pharmaceutical preparation is made from Lactic Acid?
2. (a) Name an official aldehyde produced artificially? (b) Mention other sources?
3. (a) What is Cineol—its official Latin title? (b) Into what official preparation does it enter?
4. (a) What is milk of lime? (b) Milk of Magnesia? (c) Milk of Assafoetida? (d) Milk of Sulphur?
5. What are four pharmacopoeial substances that may be called products of destructive distillation?
6. Why is glycerine employed in the manufacture of extracts?
7. Why does the U. S. P. direct the use of heat in the official process for making Tr. Kino?
8. What is the object of "wetting" a filter made of paper or cloth before beginning filtration?
9. (a) What is Donovan's Solution? (b) Is it a simple or chemical solution?
10. What oil is the least volatile of the official essential oils?

Chemistry.

R. H. Land, Jr., Examiner.

1. What do you mean by Latent Heat?
2. Define the following terms—Element, Anhydrous, Deliquescent, Efflorescent?
3. What is the difference between Analytical and Synthetic Chemistry?
4. (a) Define a Salt? (b) What is the difference between a Normal Salt and an Acid Salt?
5. What is the difference between Washed Sulphur and Precipitated Sulphur?
6. In making Seidlitz Powders, name chemicals used and state what chemical change takes place when they are mixed with water?
7. Complete the following equations: (a) $\text{FeSO}_4 + \text{K}_2\text{CO}_3 =$ (b) $\text{CaO} + \text{H}_2\text{O} =$
8. Give a chemical test for Sugar and Albumen?
9. Give a chemical Antidote for the following: (a) Nitrate Silver. (b) Oxalic Acid. (c) Caustic Potash. (d) Corrosive Sublimate.
10. (a) What is the official name of Solution Hydrogen Dioxide? (b) How is it usually prepared? (c) What per cent. of hydrogen dioxide does it contain?

Materia Medica.

S. E. Bayne, Examiner.

1. State in your own words the meaning of Materia Medica. (a) Give an example and state for what it is used.
2. What are synonyms? (a) Give name of one drug, with its synonym, and dose.
3. Give official title of Gelatin. (a) Its source and medicinal use.
4. Mention one official Glucoside. (a) From what obtained, dose and use?
5. There are two official Soaps: Write the Latin names of them. (a) Composition of each.
6. Describe Opium. (a) Name ten official preparations. (b) (What would be your price on a prescription for one pound of Gum Opium? This is a commercial question, and will not be given any rating.)
7. What official Infusion is made by cold process? (a) Why is it not made with boiling water? (b) What part of the plant is used?
8. What do you understand to be the principle of

"Serum Therapy," or Serum Therapeutics? (a) Average dose of the official Serum.

9. Give common name for Serum. (a) What is the source of "Neatsfoot Oil?" (b) Give English for Sanguis; Lac; Os.

10. Give common name for Colocynth. Medical properties of Sanguinaria. Constituents of Jaborandi. Dose of Senna.

Prescriptions and Doses.

Herman C. Shuptrine, Examiner.

1. Write a prescription, giving correct dose of strychnine for adults, containing a physiological incompatibility.
2. What would you do to make a solution of zinc chloride a pharmaceutical preparation?
3. Give the Official Titles of the following: (a) Lead Plaster. (b) Lanoline.
4. What strength is Infusion of Digitalis, and what are its therapeutic properties?
5. Give the doses of the following: (a) Caulophyllum; (b) Aqua Ammonia; (c) Fluid Extract Colchicum Seed; (d) Tinct. Rhatamy.
6. How much Menstruum would you add to five ounces of a 40% Tinct. in order to reduce its strength to 10%?
7. How many cubic centimeters in 1,000 gms. of Ether (sp. .716)?
8. Criticise the following:

R Potass. Iodide.....	3iij
Fluid extract Ipecac.....	m.xx
Ammon. Carb.....	3ii
Elix. Simp.....	q.s. 3iv
- M. Sig. Teaspoonful.
9. Write formula, using metric system, for a hundred pills, each pill containing

Aloin	1-4 gr.
Strychnine	1-60 gr.
Ext. Belladon.....	1-8
Ipecac	1-16
10. What sort of menstruum should be employed in mixtures containing Rhubarb?

Oklahoma Board Questions.

Herewith are reprinted the questions used by the Oklahoma Board of Pharmacy at an examination held October 2d, 1911. Another set of questions asked by the Oklahoma board appears in the issue of the CIRCULAR for January, 1905, page 22.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacy.

John D. Humphrey, Examiner.

1. What are ten [10] Alkaloids recognized by the Pharmacopœia?
2. (a) Is Nux Vomica a fruit or seed? (b) What two (2) Alkaloids are obtained from it?
3. What would be the precipitate if a solution of Corrosive Sublimate be added to Lime Water?
4. What are two [2] fluid extracts and two [2] tinctures which the Pharmacopœia requires shall be assayed?
5. What official tinctures are made from animal drugs?
6. (a) Give the official Latin name for this mixture?

R Ferri Sulphat.....	3.00
Myrrhae	9.00
Sacchari	9.00
Potass. Carbonat.....	4.00
Spts. Lavendula.....	30.00 cc
Aquae Rosae.....	qs. ad. 500.00 cc
- Misc.
 - (b) How much of each of the ingredients is required for 300.00 cc?
 7. (a) In what form is Silver usually found? (b) What is its most important salt?
 8. (a) What three drugs are used solely as bitter tonics? (b) Name three drugs that are emmenagogue? (c) What two (2) drugs are used chiefly as anthelmintics? (d) What two [2] drugs are used chiefly as a taenifuge?

(e) Name two[2] drugs that are irritant; one a leaf drug and one a bark drug?

9. Criticise the following prescriptions:

(a) $\mathcal{R}$ Strychnia Sulphitis..... grs. iii.
Quininae Sulphitis..... grs. xx.
Excipients qs.
Misc. ft. Pilul. No. xv
Sig. One Tid.

(b) $\mathcal{R}$ Tr. Ferri acetatis..... ss oz.
Tr. Valerianae..... ii oz.
Spiritus Ammon. Aro..... ss oz.
Suripi i oz.
Aquae q. s. ad. iv oz.
Misc. Sig; One teaspoonful every four hours.

10. (a) What alkaloid is found in ipecac root? (b) What action have alkaloids on litmus paper? (c) What acid is obtained from oil wintergreen? (d) What is the difference between oil of nutmeg and oil of mace? (e) Name two drugs of which the unexpanded flower is the part used.

Chemistry.

1. Define (a) Chemical Symbols. (b) Formula. (c) Element. (d) Acid. (e) Base.
2. Define (a) Atom. (b) Compound. (c) Molecule. (d) Amorphous. (e) Molecular. Weight.
3. Name (a) ten elements giving their symbols. (b) ten compounds by their formulae.
4. What salt is formed when the fumes of hydrochloric acid comes in contact with ammonia gas?
5. If iron wire is dissolved in dilute sulphuric acid what salt of iron is formed. What gas is disengaged? What is Sulphide of Iron?
6. What is the chemical composition of (a) Allum. (b) in what does it differ from allum exsiccatum?
7. What is the source of Ammonia? What effect has heat on salts of ammonia? What liquid preparations are official, and state strength of three of them.
8. Mercury—give (a) Source. (b) Symbol. (c) Formula of Calomel. (d) Formula of Corrosive sublimate. Give points of physical difference between calomel and corrosive sublimate with a distinguishing chemical test.
9. Phenol—(a) what is its ordinary source. (b) in what two principal shapes does it reach the pharmacist. (c) mention two antidotes.
10. What chemical antidotes are effective and should be used in case of poisoning by (a) Oxelates. (b) Morphine. (c) Chloral.

Materia Medica.

L. D. Brunk, Jr., Examiner.

1. (a) Define Materia Medica. (b) Therapeutics. (c) Chologogue. (d) Diaphoretic. (e) Alteratives.
2. What are six official Mucilaginous Substances?
3. (a) What are Astringents? (b) What are four official Mineral Astringents? (c) What are four official Vegetable Astringents?
4. (a) What official leaves of the Natural order Solonaceae yield Mydratic Alkaloids? (b) What are three official oils derived from the Botanical Family Coniferae?
5. (a) What is Black Lead? (a) Crocus Martis? (c) Kermes Mineral? (d) Turpeth Mineral?
6. (a) What is the difference between Glucose and Grape Sugar? (b) What are the official Sugars and from what source are they derived?
7. (a) What U. S. P. Tincture contains the largest amount of Alcohol? (b) The smallest?
8. (a) What official pills are directed to be coated? (b) What official pills are made by process, which involve a chemical reaction?
9. (a) What are four official drugs from plants described as Herbs, Shrubs, Trees. (b) What characteristic is common to a large number of the plants which belong to the Solonaceae?
10. (a) What are three physiological incompatibles with Atopine? (b) Chloral? (a) Solution of Hydrogen Peroxide?

Practical Work and Dispensing.

1. Describe the general process of making pills. How would you make 1 doz. pills containing 2 grs. of Quinine and $\frac{1}{2}$ gr. Berberine each and what would be your price for such a prescription?
2. Describe the general process of making Tinctures and tell how you would make 8 oz. Tincture of Opium. What would be its cost and selling price per ounce?

3. Describe the general process for making Syrups and tell how you would make 8 oz. Syrup of Wild Cherry.

4. Describe general process for making Elixers and tell how you would make 8 oz. Elixer of Iron Quinine and Strychnine.

5. What is an Emulsion? Tell how you would make the official Emulsion of Cod Liver Oil.

6. What is the difference between an Ointment and a Cerate? Describe the official method of making each.

7. Give the equivalent for each of the following in the metric system of weight: 1 dram, 2 ozs., 1 pound. Also the same in fluid measure, 1 dram, 2 ozs., 1 pint.

8. If a tincture is 10% in strength of the drug how much of the drug in 8 ozs. of the tincture? Put all your figures on the paper.

9. How would you prepare a 4% solution of Cocaine? How much of the drug will there be in a one ounce preparation? Put your figures all on the paper. What would be your price for such a prescription?

10. What are Suppositories? Tell how you would make 12 Rectal Suppositories containing one per cent. of Opium, and the price.

Evils of Commercialized Pharmacy.

In a paper read at the recent meeting of the Tennessee Pharmaceutical Association, J. O. Burge said that "pharmacy is, and must necessarily continue, more or less, at least for a good many years to come, to be a double calling; it has its professional and commercial side, and it will be hard to separate the two." The under growth of the unduly "commercial" side of the calling of the pharmacist he deprecated. He gave this version of its beginning and growth:

Twenty-five years ago, or thirty, perhaps, cut prices on "patent" medicines as an advertising scheme began to be popular with a certain class of druggists, and a few made money at it. About that time a class of persons entered the ranks of pharmacy. They had some money, and the reputed "400 per cent." in the drug business sounded good to them. They knew nothing about pharmacy; there were no restrictions or requirements in many of the States prohibiting their entering the drug business. They saw the chance to "get rich quick," bought a stock of drugs, hired a cheap clerk with some little experience at the business, opened a drug store, and became druggists, not pharmacists. They bought all their supplies, not knowing how, or not having time, as many of them expressed it, to make their preparations. This caused a good many cheap manufacturing houses to open up, who made and sold pharmaceuticals cheaper than a good article of crude drugs could be bought for. This bait led a good many lazy pharmacists to buy, who were really competent to make their own preparations, but they could buy them cheaper than they could make them. Then the custom of making tinctures from fluidextracts came into vogue, and was at once taken up by the lazy pharmacists and incompetent druggists, who had no trouble in making this class of preparations, as the formula was on the bottle. The sale of "patent" medicines without any profit began to worry the commercial druggist when the "just as good" non-secret man came along with good formulas on the label and cheap medicines in the bottle. These formulas were unworkable for the honest pharmacist, who could not take them and make the preparation put up by the "just as good" maker. Thus began what is now known as "commercial pharmacy."

This "cheap John" pharmacy, said Mr. Burge, led to the introduction in congress of several pure food and drug bills, which, after about twenty years resulted in the passage of the celebrated pure food and drugs law of June 30th, 1906. It also has led to a threatened breach between pharmacists and physicians, continued the author of the paper, who argued that the remedy for the bad conditions noted was for pharmacists to join their local, State and national associations and work together for true pharmacy. He saw improvement and thought pharmacy would soon return to its own.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Deprecates the Cheapening of Pharmacy.

To the Editor of THE DRUGGISTS CIRCULAR:

Some years ago, while a student at the Philadelphia College of Pharmacy, I had published in the college paper an article dealing with some defects of the college course, from a student's point of view. My early education had been gained in an institution that prepares for entrance to the best of our universities; and hence all our students received the most thorough training. Naturally I was well informed as to the entrance requirements of the big colleges. I knew considerable of their courses of study, their hours of lecture and quiz attendance, and the number of years embraced in their collegiate course.

Catalogues of numerous pharmaceutical colleges were often received at the store. My first reading of them taught me two things: First, that it was very easy to enter such a college, and, second, that it did not take more than two or three years to complete the course, and even then one was required to go only every other day.

Being familiar with the average four-year courses in the regular colleges and knowing that attendance at lectures was not confined to three days of the week, I thought at once that it must be easy to become a pharmacist and that there could not be much honor in passing through a college of pharmacy. It looked to me as if the colleges of pharmacy were catering to that class of men who could never have entered a university, let alone complete its course, and that they were making it just as easy as possible, intellectually and financially, for them to become pharmacists.

Nothing so cheapens anything as to make it easy to get. It is ridiculous to hold sessions every other day. If it is done that the student may earn his tuition while attending school, then how is it that it is not the universal custom for all colleges so to regulate their courses for the benefit of impecunious students? Boys who really want such an education will find a way to work and earn their money. If the three-days-a-week custom holds in order that the student may have practical experience, I think it can be shown that there is little ground for that argument. In the first place, the student has the entire vacation period to put into practice the knowledge he may have gained. The colleges have a right to broaden their practical laboratory work. It is much better that the student by constant practice in the laboratory learn the *correct* methods of manipulation, than that he acquire the habits of a preceptor which, too often, are careless and incorrect.

The colleges are presumed to set the example for pharmaceutical ethics. A student who for four days in the week works in the atmosphere of substitutions, recommending "patent" medicines, and sales of various goods of doubtful character, is very apt to reflect the personality of his preceptor and become one of that class of pharmacists without whom we could

well do. Perhaps no other profession offers such easy methods for doing dishonest things with such infinitesimal chances of being detected as does our profession. Students of pharmacy, more than any other body of men, need constantly to be taught the ethics of their business. I believe that to be a most important point.

We do not find it customary for other technical schools to have every-other-day sessions; though their aim, too, is the training of their students for eventual practical work. They devote more time to laboratory work under skilled instructors, and a student, during vacation, is at liberty to put into practice the knowledge he has gained.

There is no reason why the pharmacist, whose work is to assist in the preservation of human life, should not be as well trained as are the students in our best technical institutes. To say that the subject of pharmacy does not demand such thorough education is to belittle and cheapen it. We ought not to be satisfied except with the best. Pharmacists ought to be second to none in their educational attainments. They ought to rank with the brightest professionals. Every pharmacist ought to be a graduate of a college of pharmacy. The entrance requirements to that college ought to be as exacting as those of the best of our technical schools. Sessions should be held six days of the week, beginning in October and ending in June. The course should be four years long. Then the doctor's degree in *pharmacy* would mean something. Is there any argument why the standard should be lower? The benefits are self evident. I need not make them a part of this contribution. I do believe that every prospective pharmacist should be required to be a college graduate before he is permitted to take the board examination. But that college education ought to be such as I have outlined it.

As "patent" and proprietary medicine houses are engaged more or less in the practice of pharmacy in that they compound medicines for the presumed purpose of alleviating human suffering, it is but just that the managers of such houses be subject to the same requirements as those to which the retail druggist must submit. It would only be fair to pharmacy that the law should plainly state that every man or company of men owning or conducting either a retail or wholesale drug business, or large manufacturers of pharmaceuticals, or proprietary, or "patent" medicines, should be subject to the same license requirement as that which applies to the prescription clerk.

These suggestions are respectfully submitted to the careful thought of your readers. E. D. Cook.

[That Mr. Cook is right is the belief of many who have already bestowed much careful thought on the subject; that his tenets are several years ahead of his time is also believed by a large number. The question arises: If drug stores keep on depending more and more on side-line merchandising for their existence, and the profession of pharmacy is intrinsically raised higher and higher by such means as Mr. Cook and others propose, will there not necessarily follow a divorcement of the purely commercial and the purely professional ends of the vocation. In some of the other countries the two are now separate and it is by no means positively settled that either would suffer if they were put asunder in this. But they probably will not be during the lifetime of the present generation.—Editor THE DRUGGISTS CIRCULAR.]

An Ex-Drug Clerk Happy Because He Is an Ex.

Fayetteville, Ark., October 21st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

For eleven years I was a drug clerk and during that time I worked up from bottle washer to manager of a \$10,000 business. The largest salary I ever received was \$65 per month, and that was all the business could pay me—I know, for I kept the books.

My good wife (who, as well as I, is also a graduate of pharmacy) and I would often plan, after my return from the store at night, how we could make one dollar do the work of two, and save enough money to go into the drug business. It took all the \$65 to pay the grocery and incidental bills and buy the clothes for ourselves and two children. The drug business was overdone in our town (Stephenville, Texas), and I could see no future for me there, so decided to make a change.

After getting the Arkansas "fever" I obtained a position as traveling salesman for a box and label house on a commission basis, with headquarters at Fayetteville—a beautiful mountain city in which is located the State University of Arkansas, in which I hope to educate my children.

After securing a successor for my position who was satisfactory to the owners, I packed my household belongings and moved 500 miles, but before doing so had to go to the bank and borrow money with which to move. I mention these personal matters only to let you know that my condition was desperate and a change necessary.

Since taking up the work as a traveling salesman I have made more money than I ever made while clerking; have just completed a four weeks' trip during which I made \$256.80 above my expenses—that, however, was somewhat more than my average since going "on the road." I have yet to learn of anyone being more thoroughly satisfied with his occupation than is the writer at this time, and after eleven months of continual satisfaction I feel that I have passed the experimental stage and will never again clerk in a drug store.

While clerking I could, as a rule, sell a customer the most profitable class of merchandise: the same salesmanship now enables me to sell to the druggist and make more money than I could expect as a retail clerk.

I have thought that you might not care to publish this letter for fear that it might make some drug clerk more dissatisfied, but for the benefit of clerks I will state that there is another side—the separation from one's family (which is the hardest dose for me to swallow), the keen competition, and the necessity for possessing ability as a salesman. If a clerk can make a customer apologize for asking him to unwrap an article which she herself has selected, in order that she may exchange it for a more expensive one which he has suggested, then he may make a success as a traveling salesman.

No, Mr. Editor, I shall never be a "drug clerk" again.

H. M. VAUGHAN.

[Other interesting communications from Mr. Vaughan on the drug-clerk question appear in the issues of the CIRCULAR for May and December, 1905, pages 159 and 441, respectively. We congratulate him upon having got out of a harness which evidently

galled him severely and into a business for which he seems to be better fitted and in which his talent is more munificently rewarded.—Editor THE DRUGGISTS CIRCULAR.]

Saving Time at A. Ph. A. Meetings.

CHICAGO, November 8th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Referring again to the waste of time at meetings of the American Pharmaceutical Association: Inasmuch as time is a valuable asset of our members—and time wasted is not only a dead loss but a dead weight—I would like to inquire what was done with the Kremers motion for the appointment of a committee to devise ways and means to cut out this horrible waste. Each day lost at a convention costs each member about \$5; if 500 are in attendance this means a loss of \$2500 to the association.

Could not that committee be obliged to do some trimming on the program so as to do away with the nightmare part of the meetings—the unbearable, unspeakable, unnecessary, unwelcome rot that "don't do nobody no good nohow" and takes up time? Surely all the members do not have so much money—or its equivalent, time—that it has to be spent any old way.

WILHELM BODEMANN.

[This communication is respectfully referred to Local Secretary Scholtz, of Denver; and Charles M. Ford is hereby appointed a committee of one to see that Mr. Scholtz reads, marks, learns and inwardly digests it. In the same connection Mr. Ford might call the attention of the local secretary to Mr. Bode-mann's previous communication on the subject, in the CIRCULAR for October, page 578, and to an editorial reference to it in the issue for September, page 460.—Editor THE DRUGGISTS CIRCULAR.]

Sunday Opening.

TRENTON, N. J., October 22d, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Since 1871 I have been a reader of THE DRUGGISTS CIRCULAR, advertisements, letters and all, and have learned something from each issue. I have spent more hours in a drug store during that time than most men of my age, yet I have not lost my love of God, I have not filled an early grave, I have neither pity nor contempt for myself, and I enjoy nature's beauties with an enthusiasm that grows with the years, and appreciate the things that are true and pure and beautiful more than ever.

As I write, the nearby chimes of a church are ringing out a beautiful hymn that fills my soul with delight. But the lure of the Sabbath to-day is not the church. The crowded street cars rush by, the long trains of steam passenger cars traveling with lightning speed throughout the length and breadth of the land, the countless automobiles, distilling oil and gasoline, the motor-cyclists, bicyclists and pedestrians, all on pleasure bent, the people crowding into the candy stores and cigar stores, are not hunting for nature's beauties, are not eagerly looking for a place to worship God.

This waste of gray matter is the result of reading "Sunday Rest's" letter dated July 20th (July 20th fell on Thursday, in New Jersey). He says the hours

came and went very quickly on that sad day. Mr. Editor, the hours do not fly when we are miserable.

There are many stores, in my judgment, that could afford to close Sundays and evenings, and make just as much money, if they would dispense with a clerk. Sunday is such a hardship and drags its slow length along because we have too much time to stand around and do nothing through the week.

Ours is not a profession, it is a business, pure and simple, and the sooner we realize that the sooner we will be able to close Sundays. If we could only get some of George B. Evans' brains into our noddles how much shorter our hours would be, and how much fatter our pocket-books would look.

There are too many of us in business with too small a capacity for business. Let those of us who feel that we are downtrodden get out and try something else. The world is large, and if we hunt around no doubt we can all find soft snaps. At least, let us quit complaining and live in the sunshine of the thought that, though our hours may be longer than those of the man who wields the shovel and the hoe, yet we toil not, neither do we spin, but we all seem to live pretty comfortably, in spite of our discomforts.

DANIEL LANNING COOK.

Photographic Notes.

The appended notes may prove valuable bonds of usefulness between druggists who handle photographic supplies and their customers who are always glad to receive suggestions of the sort.

FRACTIONAL DEVELOPER.

In fractional development the exposed plate is first treated with the reducer and then with the alkali. At a recent meeting of the section on photography and microscopy of the Franklin Institute, G. Dietz suggested the following formula for fractional use:

Reducer.

Edinol	2 drams.
Hydroquinone	2 drams.
Sodium sulphite, dry.....	2 ounces.
Distilled water.....	30 ounces.

Alkali.

Sodium carbonate, dry.....	2 ounces.
Distilled water.....	30 ounces.

Mr. Dietz said that the best results were obtained by having the baths at a temperature of 65° to 70° F.

DRYING NEGATIVES RAPIDLY.

Schleider (*Photos and Focus*) says that he is enabled to dry negatives in about five minutes, at a heat as high as can be borne by the hand, by fixing them with a bath made as follows:

Sodium hyposulphite.....	4 ounces.
Potassium metabisulphite.....	150 grains.
Chrome alum.....	150 grains.
Water	20 ounces.

GLYCIN TANK DEVELOPER.

The *Photo-Era* gives the following:

Glycin	1 ounce.
Sodium sulphite, dry.....	1 ounce.
Sodium carbonate, dry.....	4 ounces.
Distilled water.....	120 ounces.

For use, this is diluted, 1 to 10, with distilled water. The developing is carried on for 20 minutes at 70° or

30 minutes at 60°. The plates must be washed thoroughly before being fixed.

SULPHIDE TONING BATH.

Namias (*Photog. Mittheil.* through *Amat. Photog.*) says that barium sulphide has many advantages over sodium sulphide for sulphide toning, chiefly because its solutions do not decompose or have a strong hydrogen sulphide odor. The author recommends the use of a saturated solution. Rapid toning is a feature of the use of the barium salt.

DEVELOPER FOR UNDEREXPOSURE.

In Photography of Moving Objects the author suggests the following developer for undertimed exposures:

Stock Solution.

Potassium metabisulphite.....	2 drams.
Sodium carbonate, dry.....	1 ounce.
Sodium sulphite, dry.....	1 ounce.
Water	20 ounces.

For use, 6 drams of this solution are mixed with 18 drams of water, and 3 grains of pyrogallol are dissolved in the mixture. The bath is used at 65° F., the tray being rocked constantly until reduction ceases. If the negative is too thin, it is immediately redeveloped in the following:

Stock solution.....	1 ounce.
Pyrogallol	5 grains.
Water	2 ounces.

Surgeon-General Favors Advancement for Army Pharmacists.

In the annual report of Surgeon-General G. H. Torney, of the United States army to the secretary of war, covering the fiscal year ended June 30th, 1911, the surgeon-general opines and recommends as follows relative to the hospital corps:

... In my opinion there is urgent need for the readjustment of the rank of the noncommissioned officers and for an increase in pay for both the noncommissioned officers and privates of the hospital corps. There is no question but that service in the hospital corps is not as attractive since the pay bill of 1898, as it was before. This bill made service for the enlisted men in the line and other staff departments much more attractive than it had been previously, while it did not increase the pay of the privates, first-class, and privates of the hospital corps, and gave only a small increase for noncommissioned officers as compared with other noncommissioned officers of the army. It is a well-known fact that promotion is much easier to obtain in the line of the Army than it is in the hospital corps, where advancement is only secured by passing a rigid examination. In addition to this there are many ways in the line of the army by which a man who is attentive to duty can increase his monthly pay from \$2 to \$9 per month. There is not the same opportunity for advancement for a hospital corps man in time of war, which is a matter to be considered as seriously influencing ambitious and intelligent men who may be thinking of enlisting. It should also be considered that the duties of members of the hospital corps are not particularly attractive to the great mass of enlisted men. The present organization of the hospital corps does not give advanced promotion for particularly worthy and deserving noncommissioned officers as provided for in other branches of the service and in the navy. It is urgently recommended that the grade of sergeant major be established for the hospital corps with the flat pay of \$75 per month and the usual increase for service, as is now allowed the sergeants, first-class. This could be done without adding to the expense of the hospital corps by reducing the number of sergeants, first-class, to 250 and allowing 30 sergeant majors with the pay above mentioned. The number of senior noncommissioned officers can be reduced to 280 in view of the number of posts that have been abandoned since congress allowed 300 sergeants, first-class. Without considering the advisability of an advanced grade for worthy noncommissioned officers there is a demand on the score of efficiency for this grade in our general hospitals, brigade posts, ambulance companies and field hospitals where sergeants, first-class, are assigned in the same command.

I therefore recommend that the number of men allowed the hospital corps be increased to 4,000; that action be taken to increase the pay of the members of the hospital corps, and that the organization be as follows: Sergeant majors, 30, at \$75 per month; sergeants, first-class, 250, at \$65 per month; sergeants, 400, at \$36 per month; corporals, 120, at \$24 per month; privates, first-class, 2,400, at \$21 per month; and privates, 800, at \$16 per month.

Some Analytical Results from North Dakota.

The October issue of the *Special Bulletin* of the food department of the North Dakota Agricultural Experiment Station contains reports of analyses of several cosmetics and medical nostrums, from which the following excerpts are taken:

Calypoline Auxiligator.

"Our analysis showed this product to contain synthetic lilac, known chemically as terpineol. Methyl alcohol was present to the extent of 57.6 per cent., while the total solids was 0.33 per cent."

Epp-o-tone.

"The analysis reported by Prof. Putt for this product is as follows:

"Technically it is in appearance a granular powder, unevenly colored pink.

"Anhydrous magnesium sulphate.... 49.1 per cent.
Water 50.8 per cent.
Color Cochineal.
Contents 4 ounces.

Eudora.

"... was labeled 'A Compound for the Hair,' and as containing 96 per cent. of methyl alcohol. . . . Our analysis of the product showed it to contain 96 per cent. of [methyl] alcohol, as claimed. The residue after evaporation was found to be composed of volatile oils and odoriferous principles which gave the characteristic odor."

May-a-tone.

"Our analysis of this product shows as follows:

"Magnesium, sulphate..... 45.9 per cent.
Borax 4.0 per cent.
Water 49.9 per cent.
Undetermined 0.2 per cent.

"The product is colored with cudbear and slightly perfumed."

Tincture of Iodine.

In the same *Bulletin* are reported the results of the analyses of 127 samples of tincture of iodine collected during the past year. Of these, but 26 are reported to have varied in iodine content not more than 1 per cent. from the official requirement; 66 were below standard; and 35 contained more than the required amount. The weakest sample contained 18 per cent. of the official proportion of iodine; the strongest had 79 per cent. too much. There were but four samples which did not contain potassium iodide.

Analytical Results in Indiana.

In its report of drug analyses made during July and August, the Indiana Board of Health announces that sophistication was found in all the samples of tincture of opium and cocaine hydrochloride; in 57.1 per cent. of the extract of lemon; in 21.4 per cent. of the extract of vanilla; in 37.5 per cent. of the linseed oil; in 43.7 per cent. of the solution of hydrogen dioxide; in 62.5 per cent. of the spirit of camphor; and in 50 per cent. of the spirit of peppermint.

The report says that all the samples of alum, olive oil, quinine sulphate, sulphur, and "simple" syrup answered the official requirements.

Drug Investigation in Massachusetts.

In the September *Bulletin* of the Massachusetts Board of Health it is stated that the board has declared unsalable, for the reasons noted, the following preparations:

Macdonald's astringent hair tonic for dandruff and hair loss, manufactured by Macdonald Toilet Specialty Company, Detroit, New York, and Toronto: "No statement of the percentage of alcohol."

Milk cordial-panna cream, a health tonic, prepared by Prof. Antonio Alai, Suterville, Pa.: "Incorrect statement of the amount of alcohol."

The following sophistications are reported also:

Camphor liniment.—Brockton Cut Price Drug Store, Brockton and Taunton: "53.5 per cent. U. S. P. strength"; South End Pharmacy, Boston: "80 per cent. U. S. P. strength"; Roma Pharmacy, Boston: "83 per cent. U. S. P. strength."

Lemon extract.—F. P. Adams & Co., Boston: "0.1 per cent. lemon oil present. Labeled 1½ per cent. oil."

Results of British and American Examinations for Licensure.

The *British and Colonial Druggist* gives the following tabulation of the proportion of successful candidates at the minor examinations in Great Britain during almost nine years:

Year.	Number examined.	Number passed.
1903.....	1,676	524
1904.....	1,510	584
1905.....	1,298	468
1906.....	1,165	400
1907.....	1,116	411
1908.....	980	354
1909.....	1,059	396
1910.....	1,027	407
1911.....	891	436
Totals	10,722	3,980

It will be seen that the average percentage of successful candidates is about 37½ per cent. From reports in the *CIRCULAR* we find that as a result of examinations conducted by the boards of pharmacy of thirty-three States and reported during the past eleven months, 1,874 persons were licensed as pharmacists and assistants out of 3,976 examined, the proportion of successful ones being almost 47½ per cent.

At the recent annual meeting of the Pharmaceutical Society of Ireland the report of the president showed that 38 per cent. of the candidates examined for the several grades of licensure were successful. In 1910 the successful ones constituted 39 per cent. of the number examined.

Chemists Wanted for Federal Positions.

An examination to be held December 13th, is announced by the United States civil service commission, with the purpose of securing eligibles for the position of *bacteriological chemist* in the bureau of chemistry, department of agriculture. The position is open to men and women and is salaried at \$1,200 a year. Applicants must be more than twenty years old. The examination will consist of tests in practical chemistry, including bacteriological chemistry. Rating will also be made on education, training, experience and fitness, and knowledge of French and German. A weight of 10 has been made for contributions to scientific literature, or a thesis of not more than 2,500 words on some subject related to bacteriological chemistry. An educational training equivalent to a reputable course of study for the degree of bachelor of science is a prerequisite for consideration for the position.

Vacancies exist in the position of *junior physical chemist* in the bureau of mines. These are open to men only between the ages of twenty and thirty years, and carry salaries of from \$1,020 to \$1,200 a year. An examination to secure eligibles is announced by the commission for December 13th. It will embrace the subjects of chemistry, physics, physical chemistry, and translation from French or German technical literature. Training, experience and fitness will be considered, and an essay or thesis will be required of each applicant. It is required that each applicant have had an educational training equivalent to a four-years' college course in science.

The Right of Privacy.

According to a note in a recent number of the *Keystone*, a Kansas City, Mo., jeweler has been ordered by the circuit court to pay \$350 to a boy whose photograph had been used without the boy's permission in an advertisement by the jeweler. The same court had, in the instance of the cause's first hearing, sustained a demurrer on the ground that a photograph was not property. This ruling was reversed by the appellate court and the subsequent hearing before a jury had the afore-mentioned outcome, November 1st.

The photograph was printed as a part of an advertisement in which the boy was quoted as saying: "Papa is going to buy mamma a watch for Christmas and somebody (I won't say who) is going to buy sister a diamond ring. What are you going to buy for me?"

Chemists to Meet.

The winter meeting of the American Chemical Society will be held at Washington, D. C., December 27th to 30th. Several sessions of the division of pharmaceutical chemistry have been provided for, and an interesting program is being prepared.

Meetings of American Pharmaceutical Association Branches.

Nashville.—At the October meeting of the Nashville (Tenn.) Branch of the American Pharmaceutical Association the secretary announced that the balloting by mail had resulted in the election of the following officers: President, J. O. Burge; vice-presidents, Prof. E. A. Ruddiman and D. J. Kuhn; treasurer, C. C. Young, and secretary, W. R. White.

An invitation was extended to all members of the parent organization in Tennessee asking them to become members of the branch without the payment of local dues.

A discussion of some of the formulas proposed for admission to the National Formulary (see last month's CIRCULAR, page 651) made up the business of the meeting held November 9th. The comment was as follows:

Compound elixir of almond.—Either the natural or the acid-free oil of bitter almonds affords satisfactory preparation, but the formula should specify which sort should be used. Synthetic oil of neroli was considered preferable to orange flower water as a flavoring ingredient. The use of kieselguhr as a filtering medium was favorably commented upon.

Aqueous elixir of glycyrrhiza.—This it was thought would fill a long-existing want.

Red elixir.—It was suggested that a small quantity of caramel be used in this to overcome the purplish tone of the cudbear.

Elixir of three bromides.—A better vehicle for this in flavor and color, it was remarked, would contain 10 per cent. of the aqueous elixir of glycyrrhiza.

Elixir of formates.—To direct that the formates be prepared extemporaneously from carbonates was considered a better method.

Samples of compound elixir of almond, compound spirit of cardamom, aqueous elixir of glycyrrhiza, red elixir, elixir of three bromides, and compound elixir of formates were presented by members.

This discussion will be continued at the next meeting.

New York.—At the meeting of the New York branch of the American Pharmaceutical Association held November 13th, the chair was occupied by Vice-President G. C. Diekmann, because of the death of President G. H. Hitchcock. Treasurer Joseph Weinstein reported that he had on hand \$12.97.

T. P. Cook, chairman of the committee on education, reported that the committee was in readiness to keep in touch with legislative activities not then begun.

For the committee on the progress of pharmacy, the chairman, Otto Raubenheimer, presented numerous abstracts of timely articles in the foreign press. Among these were notes on the use of wood naphtha in preparations for external use, mention being made of the opposition to this practice, by the *Pharmazeutische Zeitung*; a comparison of cleaning powders with soap to the advantage of the latter; analyses of spiritol, kolymos, odol, and pantopon; tests for caramel; a process for making cresols soluble; a comparison of the various preparations of digitalis; the German restrictions of the sale of aspirin and veronal; and some toxicology cases. He passed around for exhibition samples of thoradin paste and solution, granular iron and ammonium citrate, and a root seemingly of the araceæ, which was sold by grocers as green ginger. He also called attention to the book recently issued by the American Medical Association under the title *Nostrums and Quackery*.

Considerable discussion followed the reading of this report, Messrs. Lascoff, De Jonge, Flowers, Diner, Cook, and Arny taking part.

Several communications were read by Secretary Hugh Craig. One of these had to do with the telephone agitation and was supplemented by a review of the situation by C. A. Mayo. The branch approved the stand taken by the local pharmacal conference in opposition to any reduction in the rate of commissions from slot-machine telephone tolls.

Jacob Diner spoke briefly in the memory of Mr. Hitchcock; and a committee consisting of Messrs. Diner, Mayo, and Craig was appointed to draft memorial resolutions to be embodied in the minutes of the branch.

T. D. McElhenie, of Brooklyn, was elected to fill the un-

expired term of Mr. Hitchcock as the representative of the branch in the council of the parent organization.

A suggestion that the branch occasionally meet in Brooklyn was approved.

To J. L. Lascoff, G. C. Diekmann, T. D. McElhenie, Jeannot Hostman, and Alexander Gardner, were allotted for experimentation a number of formulas proposed for admission to the National Formulary (see last month's CIRCULAR, page 651).

Some little general discussion of these formulas occurred. And the secretary was instructed to request all members of the branch to comment upon the admissions and other changes proposed by the National Formulary committee.

Washington.—The first of the season's meetings of the Washington (D. C.) branch of the American Pharmaceutical Association was held November 18th, and was devoted to a discussion of matters relating to the revision of the National Formulary.

Elixirs containing but a small proportion of alcohol were considered at length; and this led to a discussion of the use and abuse of alcohol in pharmacy. It was pointed out that because of the palatability of elixirs they were often used by physicians with a total disregard of the consequences of the large quantity of alcohol they contained.

W. H. Bradbury was of the opinion that the nostrum manufacturer was to blame for the introduction of alcohol-containing proprietaries and the more or less objectionable alcohol-containing vehicles of the U. S. P. and the N. F., and that now, being compelled by legislative measures and an awakened public opinion to forsake the use of alcohol in his wares, he would no doubt drive the drug trade generally to the disuse of alcohol for all purposes other than as a solvent. Mr. Bradbury condemned the compound digestive elixir, saying that it was nothing but an alcoholic cordial.

W. S. Richardson spoke of the changes he had seen in vehicles, from the aromatic waters and syrups of bygone days to the alcoholic elixirs and cordials of to-day.

Many official elixirs can be and are used as tipples, said Dr. L. F. Kebler, citing "beef, iron and wine" as an instance.

That many elixirs can easily be replaced with aqueous preparations, was the opinion of H. E. Kalusowski, who opposed the use of alcohol except in cases where its solvent properties were necessary.

Messrs. Hunt, Motter, and Wilbert also took part in the discussion; and the following resolution was adopted:

Resolved: That the members of the City of Washington branch of the American Pharmaceutical Association present at this meeting regard with regretful disfavor the continuance in the National Formulary of preparations that can be used as tipples, and suggest that the alcohol in all National Formulary preparations be reduced or eliminated wherever not actually necessary as a solvent.

Massachusetts Association.

There has been a widespread error in the reporting of the meeting of the Massachusetts Pharmaceutical Association held at Hull, in June. The secretary has therefore sent out the following correct list of the officers chosen on that occasion: President, W. S. Briry, of Melrose; vice-presidents, W. M. Curtis, of Boston; F. J. Campbell, of Lowell; and J. T. Harper, of Great Barrington; secretary, J. F. Guerin, of Worcester; and treasurer, T. B. Nichols, of Salem.

Michigan Retail Association.

At the annual meeting of the Michigan Association of Retail Druggists held at Flint, in October, the following officers were elected: President, D. D. Alton, of Fremont; vice-presidents, J. Gilleo, of Pompeii, and G. S. Layere, of Bay City; secretary, R. W. Cochrane, of Kalamazoo; treasurer, W. C. Wheelock; members of the executive committee, C. A. Bugbee, of Traverse City; Grant Stevens, of Detroit; and D. J. Look, of Lowell.

Western Women Elect Officers.

At the annual meeting of the Woman's Pharmaceutical Association of the Pacific Coast held October 27th, at San Francisco, the following officers were elected: President, Dr. Josephine Barbat-Winslow; vice-presidents, Miss Clarissa Roehr and Mrs. J. H. Flint; treasurer, Miss Pauline J. Nast; and secretary, Mrs. R. E. White.

Volume of American Proprietary Medicine Business.

Under date of November 30th, there was sent out by the bureau of the census of the federal department of commerce and labor a preliminary compilation of statistics relative to proprietary medicines, dentifrices, capillary applications, cosmetics and perfumes. Preparations made by manufacturing chemical establishments are not included. As a part of this compilation appears the following tabulated summary:

	Census of		Per cent of increase
	1909.	1904.	1904 to 1909.
Number of establishments.....	3,642	2,777	31
Capital	\$99,942,000	\$75,607,000	32
Cost of materials used.....	\$50,376,000	\$39,494,000	28
Salaries and wages.....	\$26,904,000	\$17,888,000	50
Salaries	\$17,007,000	\$9,975,000	70
Wages	\$9,897,000	\$7,913,000	25
Miscellaneous expenses.....	\$37,027,000	\$33,567,000	10
Value of products.....	\$141,942,000	\$117,436,000	21
Value added by manufacture (value of products less cost of materials)	\$91,566,000	\$77,942,000	17
Employees:

Anti-Narcotic Doings.

Two complaints have been made against a prominent druggist of Salt Lake, Utah, charging him with illegally supplying cocaine and morphine to habitual users of the drugs, and conniving with would be purchasers to evade the provisions of the law by faked prescriptions. The charges are the result of the co-operation of the Utah Board of Pharmacy, the medical board, and the local police.

A Boston, Mass., man has been held in \$300 bail on each of two counts covering an alleged violation of the anti-cocaine law. The first count charges the forgery of a physician's name, the second is based on the possession of the proscribed drug.

An inspector employed by the California Board of Pharmacy secured evidence against three Sacramento druggists sufficient to oblige two of them to plead guilty to charges of selling illegally, and to bring about the arrest of the third. The two who plead guilty were fined \$175 each; the third was released under bond.

Capsicum in Ginger Ale.

A jury in the county court sitting recently at Philadelphia, Pa., brought in a verdict of not guilty in a case in which the offense charged was an alleged violation of the State non-alcoholic drink law, consisting in the sale of an imported brand of ginger ale containing capsicum, without this constituent being named on the label. The defense was that no capsicum was used in the product, although capsicum was used as a component part of ginger ale for many years prior to the enactment of the law in 1909, and that capsicum was a customary and accepted ingredient of ginger ale.

In his charge to the jury, the trial judge instructed the jurors to find for the defendant if they were satisfied that capsicum is and was a common ingredient in ginger ale, if they had any doubt that the pungency of the product in question was due to capsicum; and if they believed that any capsicum present in the product was not used in imitation of ginger.

Mme. Curie Gets Nobel Prize.

The Nobel prizes for 1911 were awarded early in November. The prize in chemistry went to Mme. Marie Sklodowska Curie, of the University of Paris, for her work in the field of radio-activity.

The prize in physics was awarded to Prof. Wilhelm Wien, of Würzburg University. Each prize amounts to \$40,000.

Having served the populace of Parsons, Kan., continuously for forty years—thirty of them spent in one building—the firm of W. C. Holmes & Son moved into a brand new store October 23d, and started with renewed vigor to reach the century mark.

Dinners and Similar Relaxations.

With Dr. Henry H. Rusby as the guest of honor, the Syracuse (N. Y.) Druggists' Association more than enjoyed itself at the annual banquet held November 13th. Herbert Walker was toastmaster and E. S. Dawson was historian. Dr. Rusby's address was a travelogue about the Amazonian region of South America, with stereopticon illustrations.

The New Orleans (La.) Drug Club had a supper and much post-prandial oratory on the evening of November 2d.

There is a new social club for drug-folk in St. Paul, Minn. The officers are: President, H. W. Rietzke; and secretary and treasurer, Amiel Alperstein.

Some 300 employees of the Owl Drug Company, at San Francisco and Oakland, Cal., tripped to Sacramento, October 22d, by a special train, inspected the new Owl store there, paraded, luncheoned, and held an open-air dance.

More than one hundred persons were present at the banquet of the Louisville (Ky.) Retail Druggists' Association, October 26th. Dean Gordon L. Curry, of the Louisville College of Pharmacy, presided. The principal speakers were R. M. Allen, of the State food and drugs department; William Bloomfield, of the board of pharmacy; Dr. D. S. Wilson, Simon N. Jones, Rev. P. B. Wells, and J. J. Seibers.

From the tuning up of the fiddles to the cigars after the "Dutch lunch," there was nothing but enjoyment for those present at the "smoker" of the Long Island Drug Club which was held at Brooklyn, on the evening of November 20th. The Brooklyn Pharmaceutical Association was a patron of the event.

The Wedgewood Club, of Brooklyn, N. Y., will have a minstrel show and reception at Schwaben Hall, December 7th.

Telephones in Drug Stores.*

Charles Rehfuß spoke of the telephone situation in Philadelphia, which he said was among the first cities in which druggists had made a stand for their rights at the hands of the telephone companies. The telephone was now a source of a good deal of profit to druggists in that city. On a basis of 33½ per cent. commission even some of the smaller stores there realized as much as \$50 to \$75 a month from their telephone pay stations. Some of the druggists charged 5 cents for delivering messages, and from this source of revenue secured enough to pay the wages of a boy.

Mr. Alpers said that the commission in New York was only 20 per cent. and that there was some talk of cutting it in half.

Mr. Rehfuß' comment on this statement was that if any such threats were made in Philadelphia, three-fourths of the druggists would stand together, even to the extent of ordering the telephones out of their stores.

Mr. Bodemann had tried to arouse the interest of New York druggists in the telephone situation, but had never been able to get any reply to his letter of inquiry addressed to his metropolitan brothers.

In Baltimore, said C. L. Meyer, the druggists had the situation well in hand.

Prof. Beal Resigns from Pittsburgh College.

In order that he may devote more time to his duties as general secretary of the American Pharmaceutical Association and editor of its *Journal*, Prof. J. H. Beal has resigned the chair of theory and practice of pharmacy at the Pittsburgh College of Pharmacy. He will remain on the faculty as lecturer on pharmaceutical jurisprudence.

Louis Saalbach, for several years a member of the Pittsburgh college teaching force, has been appointed to succeed Prof. Beal.

Sunday Closing.

Beginning October 29th, the drug stores of Brunswick, Ga., are closed on Sundays from 10:30 A. M. to 2 P. M.

The druggists of Amityville, N. Y., began November 5th, to close their stores between the hours of 1 and 5 on Sunday afternoons.

*From the report of last year's meeting of the American Pharmaceutical Association in the Circular for June, 1910, page 314.

German Apothecaries' Society.

At the regular meeting of the New York German Apothecaries' Society, held November 2d, Emil Roller, chairman of the scientific committee, announced that he had sent invitations to fifteen members of the society, who had a large prescription business, asking them to attend and discuss the proposed changes in the Pharmacopœia. Inasmuch as only two members had accepted this invitation, he thought it advisable to circulate a list of the proposed admissions and deletions among the members asking for expressions of opinion relative to the articles to be admitted or to be dropped. The society authorized him to do so.

Mr. Roller announced that he intended to present a paper on "Emulsions" at the next meeting.

S. V. B. Swann, chairman of the legislative committee, read a communication from a fidelity and casualty company, in which attention was called to a new law in which the giving of rebates to customers is prohibited.

Nothing new could be reported in regard to the charges brought by the municipal board of health against several druggists alleging the use of tartaric acid in solution of magnesium citrate. The cases had been postponed. It was found that the examinations made by the board and those made according to the U. S. P. were not reliable, and could not be used as legal arguments.

Mr. Swann stated that the telephone company intended to reduce the druggists' commissions from 20 per cent. to 10 per cent. A lengthy and lively discussion of this matter followed, in which Messrs. Alpers, Behrens, Klippert, Hirseman, Gilbert, and Morey took part. It was finally decided to send a circular letter to every druggist in Manhattan and the Bronx, asking them not to accept the conditions urged by the company, and not to sign any new contract.

O. P. Gilbert said that he would submit a detailed report on the jubilee celebration at the next meeting. He also suggested having an entertainment and mask-ball March 21st. Which suggestion was accepted with much applause.

After the election of three persons as members the meeting adjourned.

New York College Notes.

A regular meeting of the College of Pharmacy of the City of New York, Columbia University, was held October 17th, at which Prof. H. V. Arny, the new professor of chemistry, spoke informally on "The Trend of Modern Pharmaceutical Education."

Albert Plaut told of the meeting of the International Congress of Applied Chemistry which will meet in this city in September. It was decided to place the auditorium and other facilities of the college building at the disposal of the visitors to the congress.

The student athletic association has taken on a permanent form, and schedules for the ensuing season are being prepared.

At a meeting of the board of trustees held November 14th Dr. Virgil Coblentz was made professor emeritus in chemistry.

R. R. Schleussner, Jr., has gained the senior free scholarship for this year.

The annual banquet of the alumni association will be held at Healy's, Columbus avenue and Sixty-sixth street, Manhattan, on the evening of December 6th. The affair will be strictly informal. Tickets may be had of Prof. C. W. Ballard, 115 West Sixty-eighth street.

Kings County Society.

Telephonic grievances and the airing thereof consumed the greater portion of the time at the meeting of the Kings County (N. Y.) Pharmaceutical Society held at Brooklyn, November 14th. For the first time in several years there were no elections to or applications for membership.

Because of the illness of Dr. William Muir, whose death later is noted on page 720, the reports of several committees of which he was the chairman, were not heard.

The gratifying financial condition of the society and its subsidiary institution the Brooklyn College of Pharmacy was attested by the report of Treasurer Adrian Paradis, and T. J. France announced that the attendance at the college was the largest in its history.

The paper of the day was read by W. M. Macnaughton who had as his subject "Some Suggestions Regarding the Revision of the United States Pharmacopœia."

Dr. Rusby Lectures in Newark on Pure Drugs.

Few men have as clear an idea of what the people need in the shape of food and drugs laws, as has Dr. H. H. Rusby. Not only is Dr. Rusby a physician and a pharmacognosist but he has long made a study of drug adulteration and was regarded as an expert at detecting it long before there was such a thing as a federal food and drugs act. Dr. Rusby is a strong advocate of the passage and enforcement of State laws to prohibit the adulteration or misbranding of foods and drugs, as the federal government has no jurisdiction over such adulteration and misbranding in cases in which the food or drug is manufactured, sold and reaches the consumer all within a single State. He emphasized the necessity for State regulation of food and drug traffic in a lecture delivered before the Wednesday Club of Newark on the evening of November 15th. A synopsis of his remarks appeared in the *Newark Evening News* the next day.

Incidentally it may be mentioned that the *Newark Evening News* stands out conspicuously among the newspapers of the land as one which accords much space and intelligent treatment to matters which affect the health and lives of the public.

Ohio Doctors and Druggists Meet.

Instead of the customary order of business the Cincinnati Academy of Medicine at the meeting held October 30th, listened to papers by members of the Ohio Valley Druggists' Association. As a "joint meeting" the affair was very successful. Prof. G. B. Kaufman was the first speaker, having for his subject "The Unqualified Medicine Vender." The burden of his address was the necessity for protecting the public from the operations of the traveling medicine pedler. His arguments were so convincing that the academy passed a resolution tendering its aid to the druggists in securing the enactment of a law that will require the registration of itinerant vendors and the publication of the composition of their wares.

"Self-Medication" was the subject presented by T. D. Wetterstroem. He called attention to the alarming growth in the undirected use of those proprietary medicaments once so popular with the medical profession, and introduced by its members to the laity through the prescribing of original packages. Coal-tar synthetics, painted pellets, and the prescribing of narcotics were other targets for the speaker's shafts of fact and reason.

F. K. Kisker set forth "The Advantages of the Use of Medicines Made from Standard Formulas over Those Made from Secret Formulas." After stating the purposes of the Pharmacopœia and the National Formulary, he showed how the druggist was by education, training, and legal restriction placed in a position to accomplish these purposes for the physician. He concluded with brief descriptions of six popular official preparations.

In a paper on "What the Physician Can Do to Elevate Pharmacy," E. H. Thiesing told his hearers that pharmacy deserved the assistance of the medical profession in the endeavor to cast out the unfit. His condonation of the prescriber for the petty failings of the dispenser were often attributable to an oversight on the part of the former. He appealed for aid in bringing together pharmacy and pharmacists, medicine and physicians for the ultimate benefit of the public.

Several informal talks followed the address and later a luncheon was served.

At its recent annual meeting the Calvert Drug Company, a Baltimore co-operative buying organization, elected the following officers: President, H. F. Lindeman; vice-president, R. E. L. Williamson; secretary, J. F. Frames; and treasurer and manager, J. G. Beck. These officers, together with F. W. Schanze, C. L. Meyer, and G. C. Patterson, constitute the board of directors.

David H. Ross, of Philadelphia, a member of the executive committee of the Philadelphia Association of Retail Druggists and formerly secretary of the Philadelphia Wholesale Drug Company, is now a member of the council of the Quaker City, having been elected to represent the thirty-first ward.

The British parliament, by an act that became effective in August, has decreed that no person may use the emblem of a red cross on a white ground, the words "red cross" or "Geneva cross" for any purpose without authority from the army council.

When Cod Liver Oil Advanced.*

BY ELLIS PARKER BUTLER.

"I remember one story I told—" Uncle Ashdod began. "I remember all you ever told," said Sim Perkins unkindly. "I've heard 'em over and over, until—"

"And this perticklar story I told to what was just about the biggest old codfish I ever seen," said Uncle Ashdod, and Sim Perkins pricked up his ears.

"What's that you say?" asked Sim. "You wasn't tellin' tales to codfish, was you?"

"I felt it was my duty," explained Uncle Ashdod. "Funny stories they was, too. Anything to make a codfish laugh was what I told. When a feller has a conscience like what I've got, and he feels he's got to tell funny stories to codfish, why, he ups and does it. Them consumptive snakes—"

"What's that?" said Sim Perkins hastily. "You didn't mention no snakes."

"Consumptive snakes was what I said, and consumptive snakes was what they was," said Uncle Ashdod firmly. "Yeller sea snakes from off the coast of Burmah, and when they scooted for the coast of Norway—"

"I thought yeller sea snakes was hot climate snakes, but that don't matter. Nothin' matters when you get talkin' once," said Sim Perkins.

"So they be! So they be!" said Uncle Ashdod frankly. "Hot climates is the habitat of them yeller sea snakes; the hotter the better, but not too hot. Seems like they had had a mighty especial hot summer down Burmah way that year I sailed the Sally Jane down there. Mighty hot! It was so hot the water was all boilin' around the ship, and when I looked down at them poor snakes, all dyin' of consumption—"

"Never heard of a snake dyin' of no such thing!" said Sim Perkins.

"Lack of good air," said Uncle Ashdod shortly. "Water boiled, and boiled all the air out of it. Naturally them snakes got consumption. And when I seen how it was with 'em I just says to the mate, says I, 'Mate,' I says, 'see them poor consumptive snakes? It would be a great thing,' I says, 'if they knew cod liver oil was good for consumption,' I says, 'and, think, mate,' I says, 'of all them codfish off the coast of Norway! If some feller was to bring a cargo of cod liver oil,' I says, 'and dump it right here into this water,' I says, 'them snakes would get well,' I says. That's what I says. 'Them snakes would recover,' I says."

"So you set out and got a cargo of cod liver oil?" said Sim Perkins scornfully. "That's what you did, ain't it? Oh, yes!"

"If I was to tell you that," said Uncle Ashdod, "I'd be tellin' you a lie, Sim, and I wouldn't lie to you. No, sir! I didn't get no cargo of nothin'. Just as soon as them consumptive yeller water snakes heard what I said to the mate they scooted off. Scooted, that's the only word for it. And I hadn't no idea where they went, neither. But about two years later, when I was loadin' a cargo of peanuts at N'Orleans, the mate—he was sittin' on th' dock readin' a newspaper—says, says, he, 'Huh! This is funny!' So I says, 'What's so funny?' And he says, says he, 'Cod liver oil business gone to ballyhack,' he says. 'How so?' I says. 'Well, sir,' he says, 'nobody can't make head nor tail of it,' he says, 'but the cods they're catchin' off th' coast of Norway this year ain't got no livers. They've caught a million,' he says, 'and not one cod had a liver into it. And when they ain't got livers nobody can make cod liver oil out of 'em.'"

"So you went and fixed it up all right, didn't you?" said Sim Perkins sarcastically. Uncle Ashdod coughed modestly.

"Leastways I done what I could," he admitted. "'Mate,' I says, 'spread sail an' up anchor an' get a hustle on. We've got to go right plump to the coast of Norway. Peanuts be durned!' I says. 'I've got to save that there cod liver oil business.' So we made good time, and it was just like I expected it would be. Them consumptive yeller water snakes was eatin' all the cod livers."

"I thought maybe it would turn out that way," said Sim Perkins.

"And I knowed it would!" said Uncle Ashdod, unabashed. "Them yeller water snakes had heard what I said down there off the coast of Burmah, and when they scooted they scooted for Norway and begun eatin' cod livers. So I felt

sort of responsible. And for twelve months I sat on the bowsprit of the Sally Jane and told funny stories to them codfish—"

"To sort of encourage 'em to grow new livers?" asked Sim.

"No, sir!" said Uncle Ashdod. "To keep 'em from yawning. You see, them yeller water snakes didn't have no sense of humor. They was very dry talkers, as you may see, and one of 'em would get in front of a lively lookin' codfish an' begin tellin' a story. By an' by the cod would sort of lose interest, but that snake would hold it fascinated with its eye, and go on spinnin' that dry yarn, and by an' by the cod would yawn a little. Snake would go on yarnin'. Cod would yawn a little more. Snake would go on yarnin'. Cod would yawn and yawn and yawn, and all of a sudden—Bish!—the snake would dash its head down that poor cod's throat and grab its liver, and—swish!—it would dart out of that cod's throat again and scoot off with the liver, to eat it quiet like. That's what happened to all them cods and all them cods' livers."

"Ho, hum!" said Sim Perkins, stretching his arms.

"So I told a few funny stories," said Uncle Ashdod, "and that kept them cods from feelin' yawnish. 'Course,' he admitted, "they opened their mouths to laugh at what I was tellin' 'em, but they wasn't yawnish and indolent and too tired to do nothin'. Them funny stories I told 'em waked 'em up, like my yarns always wakes folks up and—"

"Ho, hum!" said Sim Perkins, wearily.

"And when a consumptive yeller water snake poked its head into a cod's mouth, snip! the cod bit its head off."

But Sim Perkins opened his mouth and yawned and yawned and yawned.

"Ye durned old codfish!" said Uncle Ashdod disgustedly.

The Confiding Skeptic.*

You can't make William Brown believe

There was an Adam or an Eve—

No, sir! He says that's just a myth

To play on people's feelings with.

It's no use to give William tracts,

He says he runs his mind on facts!

Yes, William's baldness has grown chronic.
Although he used the barber's tonic!

And William Brown he says the flood
Is just a myth, as plain as mud.
He says old Noah never made
The ark, but on dry land he stayed.
He's from Missouri, and you know
That sort o' man you've got to show.

Yes, his dyspepsia's nearly killed him,
Although with stummick balm they filled him.

"Humph!" William Brown will say, "that tale
About old Jonah and the whale
Is all pure legend! Why will you
Believe a thing you know ain't true?
Now I will not believe a bit
O' stuff that isn't definite!"

Yes, Brown's rheumatic pains still hold him,
In spite of what the druggist sold him

And William Brown will almost fight
If you say his views are not right.
"Don't try to talk to full grown men
O' Daniel in the lions' den!"
He'll shout till others stand aloof,
"I won't believe till you bring proof!"

Yes, Brown gulps down without a quiver
Old Doctor Bink's Dope for the Liver.

A fraud-order has been issued by the postoffice officials denying the use of the mails to the exploiters of "parfait amour" a "love-inducer" in the form of a chewing gum.

Customer: Have you invisible face powder? Drug clerk: Yes, ma'am, what color? Customer: Let me see them, please.

*From the New York Times.

*From the Chicago Post.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

- ALABAMA—February 13th, at Birmingham. E. P. Galt, Selma.
- ARIZONA—A. G. Hulett, Phoenix.
- ARKANSAS—J. F. Dowdy, Little Rock.
- CALIFORNIA—January 15th, at Los Angeles; January 22d, at San Francisco. Louis Zeh, San Francisco.
- COLORADO—S. L. Bresler, Denver.
- CONNECTICUT—December 5th, at Hartford. J. A. Leverty, Bridgeport.
- DELAWARE—N. C. Downs, Wilmington.
- DISTRICT OF COLUMBIA—January 11th and 12th, at Washington. S. L. Hilton, Washington.
- FLORIDA—January 16th and 17th, at Jacksonville. D. M. Ramsaur, Palatka.
- GEORGIA—April —, at Atlanta. C. D. Jordan, Monticello.
- IDAHO—J. M. Starrh, Shoshone.
- ILLINOIS—F. C. Dodds, Springfield.
- INDIANA—January 9th and 10th, at Indianapolis. W. H. Fogas, Mt. Vernon.
- IOWA—December 5th, at Des Moines. E. J. Moore, Des Moines.
- KANSAS—W. E. Sherrieff, Ellsworth.
- KENTUCKY—January 9th and 10th, at Covington. J. W. Gayle, Frankfort.
- LOUISIANA—F. E. Earhart, New Orleans.
- MAINE—December 13th and 14th, at Augusta. F. W. Bucknam, Skowhegan.
- MARYLAND—Ephraim Bacon, Roland Park.
- MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
- MICHIGAN—J. J. Campbell, Pigeon.
- MINNESOTA—January 15th and 18th, at Minneapolis. C. T. Heller, St. Paul.
- MISSISSIPPI—April 2d, at Jackson. L. H. Wilkinson, Greenwood.
- MISSOURI—December 6th, at Hannibal. C. E. Zinn, Kansas City.
- MONTANA—April 10th, at Helena. S. J. Coffee, Missoula.
- NEBRASKA—A. V. Pease, Fairbury.
- NEVADA—R. L. Prouty, Tonopah.
- NEW HAMPSHIRE—December 27th, at Concord. A. S. Wetherell, Exeter.
- NEW JERSEY—January 18th and 19th, at Trenton. H. A. Jorden, Bridgeton.
- NEW MEXICO—A. J. Fisher, Santa Fe.
- NEW YORK—W. L. Bradt, Albany.
- NORTH CAROLINA—December 5th, at Raleigh. F. W. Hancock, Oxford.
- NORTH DAKOTA—March 19th, at Fargo. W. S. Parker, Lisbon.
- OHIO—F. H. Frost, Columbus.
- OKLAHOMA—January 9th and 10th, at Oklahoma City. J. C. Burton, Stroud.
- OREGON—F. C. Pozzi, Portland.
- PENNSYLVANIA—L. L. Walton, Williamsport.
- RHODE ISLAND—December 5th, at Providence. J. E. Brennan, Pawtucket.
- SOUTH CAROLINA—March 20th, at Columbia. F. M. Smith, Charleston.
- SOUTH DAKOTA—E. C. Bent, Dell Rapids.
- TENNESSEE—January 16th, at Nashville. I. B. Clark, Nashville.
- TEXAS—January 16th, at Austin. R. H. Walker, Gonzales.
- UTAH—January 16th and 17th, at Salt Lake. W. H. Dayton, Salt Lake.
- VERMONT—D. F. Davis, Barre.
- VIRGINIA—January 23d, at Richmond. T. A. Miller, Richmond.
- WASHINGTON—December 27th and 28th, at Seattle. James Lee, Seattle.
- WEST VIRGINIA—A. Walker, Sutton.
- WISCONSIN—January 16th, at Madison. Edward Williams, Madison.
- WYOMING—C. B. Gunnel, Evanston.

Alabama Board.

Of the thirty-seven candidates for registration examined at the meeting of the Alabama Board of Pharmacy held October 10th, at Montgomery, the following twenty-eight were successful:

W. M. Curry, M. J. Demony, C. B. Dyar, E. H. Edward, W. E. Evans, F. L. Flaxo, L. P. Fort, L. C. Gillespie, S. H. Henderson, Jr., Francis High, Lewis Howle, J. L. Hughes, A. B. Jarrell, J. H. Jenkins, C. C. King, J. D. King, W. L. Lamar, Jr., A. E. Lounds, S. H. Maxwell, V. B. Oliver, J. K. Scott, G. M. Shackelford, S. W. Stanford, C. E. Stuffell, J. L. Tew, Vera Thompson, Arthur Wood, and B. H. Wyatt.

Samuel Williams, of Troy, was chosen as president by the board. W. E. Bingham, of Tuscaloosa, has been named by the governor to succeed himself as a member of the board.

The next meeting will be held at Birmingham, February 13th.

California Board.

At the meeting of the California Board of Pharmacy held at Los Angeles and later at San Francisco, beginning October 9th, the following persons were the successful applicants for registration:

As pharmacists—E. A. Aldrich, Leonard Aquiline, C. H. Arthur, G. C. Baker, M. W. Bartholomew, C. C. Bruch, C. E. Bunnell, R. C. Burnett, J. E. Burton, Andrew Burvenich, Thomas Capell, G. G. Carpenter, Benjamin Dill, V. P. Doty, F. W. Edwards, A. H. Fisk, R. C. Gilliland, E. L. Griffith, P. H. Ghruhn, L. E. Happell, Henry Henkin, S. P. Herron, G. R. Hinckley, J. B. Hine, W. H. Hobin, T. W. Howey, G. A. Jacob, W. C. Johnson, D. S. Katz, W. B. Kurtz, L. W. Kurtzman, A. R. Lainer, Fritz Lainer, E. J. Lewis, Samuel Lindenbaum, J. I. Lorton, J. A. W. Luck, J. B. MacDonald, S. C. Maloney, J. F. Martin, Albino Martinetti, W. E. Matern, A. M. Maynon, W. J. Mentz, Philip Metz, G. T. Morris, D. W. Ostrom, L. R. Pardee, G. P. Peck, E. G. Poirier, W. D. Pratt, M. S. Robertson, I. G. Rodda, V. L. Rodda, E. H. Seeliger, James Shalda, F. P. Shannon, W. H. Smith, F. E. Starr, F. D. Tallman, R. L. Terrell, H. N. Thompson, O. L. Ward, and H. E. Wolfe.

As assistants—C. E. Brunger, A. K. Dellarowe, G. A. Doan, C. M. Drumm, P. A. Dubois, Jr., Lester Gawthrop, Raymond Gillis, F. H. Grant, I. J. Hamilton, I. J. Heckman, B. B. Hoffmaster, C. O. Howard, J. L. Hume, Henshaw Jee, Jesse Jensen, W. T. Jones, Herbert Lewis, N. W. Long, W. A. Mathison, E. L. Mazy, R. H. McGarvin, O. B. Pennington, W. B. Pope, F. F. Rajotte, H. B. Reid, H. F. Saake, P. F. Sage, and J. R. Turner.

The board has been quite active in breaking up the illicit sale of narcotics by druggists. Several dope-sellers have paid large fines as a result; details are given on page 714.

The next meeting of the board will be held at Los Angeles and San Francisco, beginning January 9th and continuing for two weeks.

Georgia Board.

There were eighty candidates examined by the Georgia Board of Pharmacy at the meeting held November 6th and 7th at Atlanta, the following thirty-six passing:

J. C. Armstrong, of Madison, Fla.; B. J. Balkcom, of Macon; C. T. Beacham, Jr., of Dexter; G. H. Bledsoe, of Montezuma; S. F. Boifeuillet, of Macon; W. E. Brice, of Atlanta; E. N. Capers, of Woodruff, S. C.; W. N. Carter, of Columbus; E. E. Christian, of Morganfield, Ky.; A. C. Cook, of Adairsville; E. E. Cox, of Stillmore; J. B. Davis, of Sasser; J. W. Davis, of Atlanta; J. A. Delgado, of Jacksonville, Fla.; G. B. Etheridge, of Quitman; G. C. Guerart, of Huyton; W. S. Gunn, of Graymount; R. L. Hays, of Mansfield; J. W. Jacobs, of Grayson; S. A. Jordan, of Slocomb, Ala.; J. D. Juhan, of Crystal River, Fla.; Margaret Kimmel, of Kirkwood; C. C. King, of Dundee, Ky.; K. W. King, of Rome; A. J. Lane, of Franklin; Hugh Legg, of Malena; O. L. Lockhart, of Brookville, Fla.; H. S. McCurry, of Atlanta; T. S. McGahu, of Lithonia; R. P. Nicholson, of Callumville, Ala.; W. C. Owens, of East Atlanta; J. I. Poole, of Lawrence, S. C.; D. S. Peters, of Tampa, Fla.; L. E. Treadway, of Anniston, Ala.; D. H. Varw, of Tampa, Fla.; and R. W. Wooten, of Helena.

The next meeting of the board will be held at Atlanta in April.

Illinois Board.

At the meeting of the Illinois Board of Pharmacy held October 24th and 25th, at Springfield, forty-four persons

made application for registration as pharmacists, fourteen as assistants and two applied for local registration. The successful ones numbered eleven, six and one in the respective classes; their names follow:

As pharmacists—S. H. Collins, of Chicago; W. S. Denton, of Beardstown; Max Feldman and F. R. King, both of Chicago; A. P. Niemeyer, of Quincy; D. H. Stone, of East St. Louis; G. H. Stoutin, of Springfield; Frank Samuelson, of Chicago; B. S. Thesen, of Quincy; K. H. Wendler, of Nashville; and B. R. Wooters, of Centralia.

As assistants—S. W. Burda, of Evanston; A. E. Cooper, of Chicago; T. B. Douthill, of Centralia; W. E. Purcell, of Equality; G. W. Stuntz, of East St. Louis; and L. A. Wolf, of DuQuoin.

As local registered pharmacist—J. C. Robertson, of Illinois.

Indiana Board.

Two Indianapolis druggists have lost their licenses as pharmacists through revocation by the Indiana Board of Pharmacy on the grounds of gross immorality. The alleged offence was illicit liquor selling. The cases have been appealed.

Iowa Board.

Solution of hydrogen dioxide under a ruling of the Iowa Board of Pharmacy is not a proprietary medicine and therefore may not legally be sold by any person other than a registered pharmacist. The board has recently been taking steps to secure a more nearly universal regard for this ruling.

In a recent instance the board ruled that an applicant for registration must be able to take the examination in the English language. It has also been decided that no person who gets a general average of less than 75 per cent. or who fails to get at least 60 per cent. in any one subject at an examination shall be licensed. Preparations are being made so as to permit tests in practical work to be made a part of the examination.

Kentucky Board.

The Kentucky Board of Pharmacy at the meeting held October 10th and 11th, at Mt. Sterling, examined twelve applicants for registration. The following nine passed:

As pharmacists—A. T. Bassett, of Mt. Sterling; R. P. Holland, of Murray; H. A. Oelrich, of Covington; H. F. Pesel, of Louisville; T. K. Richards, of Owingsville; H. A. Weichelman, of Covington; and Hugo Weiss, of Cincinnati, O.

As assistants—W. J. Cantrell, of Princeton; and R. H. Phelps, of New Albany.

G. O. Patterson, of Howesville, entered upon his duties as a member of the board; he succeeds J. O. Cook, of Hopkinsville.

Officers for the ensuing year were elected as follows: President, J. H. Martin, of Winchester; and treasurer, R. H. White, of Mt. Sterling. J. W. Gayle, of Frankfort, was retained as secretary, that official being a non-member.

The next meeting will be held January 9th and 10th, at Covington.

Maine Board.

Of the nineteen candidates for registration examined at the meeting of the Maine Board of Pharmacy held October 11th and 12th, at Augusta, the following four passed:

P. J. Begin, of Augusta; R. E. Gray, of South Paris; A. F. Kelleher, of Orono; and F. L. Riley, of Bangor.

The members of the board and F. H. Wilson, of Brunswick, and C. H. Davis, of Bangor, ex-members, enjoyed a dinner party subsequent to the meeting.

The next meeting of the board will be held December 13th and 14th, at Augusta.

Maryland Board.

At the October meeting of the Maryland Board of Pharmacy held at Baltimore, the following persons passed the examinations of candidates for registration:

As pharmacists—L. J. Cohen, Leon Dettelbach, R. T. Kelly, H. G. Lehr, H. W. Matheray, C. O. Miller, R. G. Phelps, N. E. Shakespeare, J. A. Sollod, J. F. Stultz, and A. D. Walker.

As assistants—J. S. Austerlitz, Flora Blattstein, G. R. Brooks, J. W. Brown, Christian Fiske, J. B. Hihn, Jr., J. J.

Kerr, Hermann Metz, F. H. Mustard, E. W. Schotta, and M. L. Winkel.

Massachusetts Board.

At the meetings held October 3d and 10th, the Massachusetts Board of Pharmacy examined thirty-six applicants for registration, and passed the following eighteen:

As pharmacists—J. E. Harris, of Cambridge; Charles Leibel, of Boston; H. J. Masse, of New Bedford; Theodore Montcalm, of Holyoke; J. A. Ryan, of Boston; T. E. Soucy, of Taunton; and H. G. Tuttle, of Watertown.

As assistants—W. D. Barnes, of Waltham; G. A. Bridges, of Bristol, R. I.; J. A. Hurley, of Lexington; E. P. Kelley, of Woburn; E. E. Kendall, of Plymouth; F. J. Lambert, of Somerville; P. E. Mannion, of Fall River; C. C. Northrop, of Gardner; W. J. Taylor, of Providence, R. I.; L. A. Webber, of Milford; and Herman Weinstein, of Bristol, R. I.

Minnesota Board.

Thirteen passed out of fifty-one examined was the result of the examination of candidates for registration held by the Minnesota Board of Pharmacy at Minneapolis in October. The successful ones are:

As pharmacists—E. G. Carlson, of Duluth; R. E. Desmond, of Rushford; C. A. Errickson, of Minneapolis; K. F. Fuhlbruegge, of Sandstone; W. F. Hoppe, of Willmar; H. O. Kadlec, of Minneapolis; and H. E. Snyder, and Oscar Swoboda, both of St. Paul.

As assistants—E. F. Budde, of Minneapolis; H. H. Hart, of Minnebagio; E. M. Nesse and W. M. Peters, both of Minneapolis; and C. O. Peterson, of St. Paul.

The next meeting of the board will be held January 15th to 18th, at Minneapolis.

Mississippi Board.

At the October meeting of the Mississippi Board of Pharmacy, sixty-seven candidates for registration were examined, of whom thirty-seven passed.

The next meeting of the board will be held April 2d, at Jackson.

Missouri Board.

As a result of the examinations conducted by the Missouri Board of Pharmacy during its meeting held October 9th, at St. Louis, the following persons were licensed to practice:

As pharmacists—C. R. Archibald, Hugo Baepher, W. C. Barton, Vincenzo Chiana, H. Dennhardt, H. G. Douglas, L. E. Ellis, L. A. Engel, Solomon Feigenbaum, Sister M. E. Hogan, Sister M. I. Hogan, E. B. Kent, Sister M. B. Kuyven, G. C. McCormack, F. H. McMurtry, I. A. Melnick, Sister M. E. Mertens, A. E. Mueller, R. B. Myers, W. E. Pipert, Serafino Rapini, Sister M. S. Sallerman, Agnes Smiley, W. J. Stanley, F. A. Steiner, O. L. Wallar, Sister M. D. Wendell, William Wetteroth, and S. H. W. Wortmann, all of St. Louis; W. A. Campbell, E. E. Davis, E. T. Douglass, M. L. Kidwell, L. B. Kinnear, T. A. Linck, D. R. Osborne, Evan Pugh, R. C. Puterbaugh, C. H. Shelton, J. H. Skiles, C. C. Slaughter, P. A. Taneyhill and A. I. Trout, all of Kansas City; E. E. Alley, of Princeton; J. C. Bowman, of Triplett; T. C. Brickley, of De Soto; Lee Burton, of Huntsville; Sanford Clevenger, of Plattsburg; R. A. Corbett, of Marshfield; C. L. Cravens, of Excelsior Springs; H. A. Dinges, of Red Bud, Ill.; B. E. Drew, of Ethel; M. W. Ewing, of Trenton; R. W. Finley, of Chaffee; C. J. Fitzgerald, of Mexico; LeRoy Fitzsimmons, of Muscatine, Ia.; G. T. Fleming, of Poplar Bluff; W. A. Franke, of Carrollton; J. A. Gray, of Watson; G. H. Hary, of Clinton; G. L. Hawkins, of East Prairie; E. W. Highfill, of Marshfield; A. W. Hohlt, of Farina, Ill.; G. S. Hopkins, of Nevada; F. E. Hottinger, of Axtell, Kas.; H. H. Hubbard, of Cabool; E. O. Hughes, of Excelsior Springs; A. H. Hulse, of Powersville; L. W. Hume, of Armstrong; J. C. Humphreys, of Laredo; E. B. Jacobi, of Fayette; E. B. Johnston, of Doniphan; S. W. Jones, of Maryville; G. S. Kahl, of Hannibal; O. E. Kidwell, of Green City; T. A. King, of Gallatin; W. E. King, of Mexico; F. L. Kirby, of Paris; C. W. Lyon, of Maitland; E. G. Magruder, of Madison; J. M. Marmaduke, of Deepwater; H. N. McDaniel, of Pattonsburg; C. E. Montgomery, of Owensboro, Ky.; A. M. Moore, of Galena, Kas.; L. J. G. Morrison, of Lawrenceburg; H. S. Owens, of Hannibal; Arthur Pabst, of Anderson, Ind.; R. R. Peek, of Pine Lawn; H. O. Perkins, of Liberty; W. F. Perkins, of Excelsior Springs; A. J. Porter, of

Manhattan; Leo Prince, of Webb City; F. B. Quick, of Memphis; C. A. Rigg, of Mexico; L. C. Rosenthal, of Trenton; W. E. Schuller, of Springfield; H. G. Seitz, of Perryville; S. G. Sidebottom, of Chula; L. A. Sitherwood, of Sandova, Ill.; C. L. Smith, of Kearney; D. H. Stone, of East St. Louis; C. C. Swan, of Maywood; R. J. Teel, of Webb City; G. D. Thomas, of White City, Ia.; H. G. Thomas, of Auxvasse; H. A. Tinney, of Memphis; C. E. Topliffe, of Selina, Kas.; C. C. White, of New Madrid; I. D. Witherow, of Tarkio; and A. B. Young, of Perry.

As assistants—A. G. Burnette, J. J. Burns, C. J. Hoffman, W. H. Kaempf, L. H. McGinnis, F. G. Messerschmitt, A. L. Raithel, and H. E. Steyh, all of St. Louis; H. R. Arnold, of Brunswick; H. D. Brown, of New Bloomfield; I. A. Canada, of Nelson; W. L. Catron, of Bigelow; L. W. Cockrell, of Dewitt; M. C. Finch, of Mount Vernon; L. S. Geiger, Jr., of Boonville; F. J. Kerlagon, of Farmington; R. E. Lister, of Clarence; Lela Maret, of Newtonia; Burd Odell, of Miller; Henry Phillips, of Goodman; O. J. Ramspott, of Wellston; Jacob Ryburn, of Chillicothe; R. J. Shoop, of Columbus Junction, Ia.; J. C. Tompkins, of Fayette; and J. E. Worley, of St. Joseph.

After January 1st, candidates for registration as pharmacists will be required to have been registered as assistants for two years.

The next meeting will be held at Hannibal, December 6th.

Montana Board.

At the meeting of the Montana Board of Pharmacy held October 10th to 12th, at Great Falls, twenty-three applicants for registration were examined, twenty-two, the following, being successful:

As pharmacists—E. E. Adams, of Harlem; W. A. Bade, of Corvallis; Burt Bosan and W. P. Callow, both of Great Falls; L. S. Chaffin, of Harlilton; G. A. Challman, of Hardin; H. G. Harvey, of Anaconda; E. A. Hawkins, of Kalispell; M. E. Pichke, of Somers; Frank Reavley and R. C. Trumbull, both of Great Falls; H. O. Turner, of Sidney; O. L. Veach, of Helena; Fred Voegli, of Bozeman; and G. H. Willett, of Kalispell.

As assistants—G. L. Dunkleberger, of Billings; W. M. Eaman, of Shelby; Fred Hudson, of Plentywood; R. Johnston, of Poplar; J. S. McKebbin, Jr., of Great Falls; E. M. Provost, of Big Timber; and G. L. Sorenson, of Manhattan.

The officers and members of the board are: President, T. M. Kehoe, of Billings; secretary, S. J. Coffee, of Missoula; and treasurer, Emil Storz, of Helena.

The next meeting of the board will be held April 10th, at Helena.

New Hampshire Board

H. E. Rice, of Nashua, has succeeded F. H. Wingate, of the same city, as a member of the New Hampshire Board of Pharmacy. The board is at present constituted as follows: E. H. Currier, of Manchester, president; A. S. Wetherell, of Exeter, secretary; and H. E. Rice, of Nashua.

The next meeting of the board will be held at Concord, December 27th.

New Jersey Board.

At the October meeting of the New Jersey Board of Pharmacy, the following passed the examinations of candidates for registration:

As pharmacists—Jacob Armm, F. L. Feindo, H. Kleinan, David Lesser, Saul Meylackson, and Abraham Teifeld, all of Newark; W. L. Blauvelt, of Englewood; H. H. Boltz, of Philadelphia, Pa.; G. F. Campfield, of Irvington; G. W. Dickie, of Morristown; W. S. Doe, of Jersey City; C. S. Gutzéit, of Philadelphia, Pa.; J. H. Kamerling, of Paterson; Max Kimmel and Abraham Lubman, both of New York, N. Y.; Solomon Major, of Philadelphia, Pa.; W. R. McLaughlin, of Trenton; Samuel Niremblatt, of Brooklyn, N. Y.; L. K. Paxson, of Lancaster, Pa.; Reuben Podolsky, of New York, N. Y.; J. G. Rapoport, of Philadelphia, Pa.; W. W. Rose, of Penn Grove; Robert Seiler, of Long Branch; Elias Shaker, of Poughkeepsie, N. Y.; G. H. Sleafator, of Atlantic City; T. R. Stephan, of Trenton; N. W. Teplitzky, of New York, N. Y.; W. E. Van Eerde, of Paterson; and B. R. Wagner, of Plainfield.

As assistants—Abraham Goldstein, Abraham Hailperin, E. J. Kaiser, and Oscar Singer, all of Newark; J. H. Barlow, of Highland Park; Solomon Lichtenstein, of Jersey

City; W. H. Richmond, of Trenton; and Irving Yudizky, of Orange.

The next meeting of the board will be held at Trenton, January 18th and 19th.

North Dakota Board.

The North Dakota Board of Pharmacy met at Fargo, October 17th to 19th, and examined twelve applicants for registration. The following seven were successful:

As pharmacists—Geo. Bergman, of Balfour; E. O. Larson, of Minot; S. A. Sjoblom, of Bismarck; and Andrew Teilgen, of Jamestown.

As assistants—A. J. Anderson, of Park River; F. W. Slawson, of Fargo; and J. E. Thro, of Annamoose.

The next meeting of the board will be held March 19th, at Fargo.

Pennsylvania Board.

Five Philadelphia dealers in photographic supplies have been arrested at the instance of the Pennsylvania Board of Pharmacy on a charge of failure to comply with the provisions of the law regulating the sale of poisons.

A druggist and his clerk of the same city were prosecuted by the board for the sale of a "catarrh-cure" nostrum alleged to contain cocaine.

Tennessee Board.

Of the sixteen applicants for registration examined by the Tennessee Board of Pharmacy at the meeting held October 17th to 19th, at Knoxville, but two were successful; these are:

C. F. Bird, of Adamsville, Ga.; and F. B. Reid, of Chicago, Ill.

The next meeting of the board will be held January 16th, at Nashville.

Utah Board.

At the meeting of the Utah Board of Pharmacy held October 17th and 18th, at Salt Lake, eight candidates for licensure were examined, the following two being successful:

A. C. Eddington, of Salt Lake; and Edward McCleary, of Ogden.

The following were registered under the reciprocal exchange of certificates with the boards of other States:

S. A. Denel, of Rock Springs, Wyo.; H. A. Isham, of Vernal; W. J. Roswear and George Schultz, both of Salt Lake; T. A. Shoemaker, of Manti; G. A. Solomon, of Ogden; and C. Wiswall, of Garland.

The board has offered a reward of \$200 for evidence that will lead to the conviction of the persons supplying narcotics to "bootlegging" pedlers. It was decided to petition the legislature for an act making the promiscuous possession of cocaine or morphine a misdemeanor.

The next meeting of the board will be held January 16th and 17th, at Salt Lake.

Washington Board.

The Washington Board of Pharmacy has reorganized and is now officered as follows: President, J. H. Closson, of Seattle; and secretary, James Lee, of Seattle. The other members are C. Ossewald, of Seattle; Peder Jensen, of Tacoma; and A. F. Maxwell, of Spokane.

New England Association of Boards.

A meeting of the New England Association of Boards of Pharmacy was held at Boston, November 20th, being devoted chiefly to the consideration of methods of regulating the practice of pharmacy. Officers were elected as follows: *President, D. F. Davis, of Barre, Vt.; vice-president, J. A. Pearce, of Providence, R. I.; and secretary-treasurer, F. W. Bucknam, of Skowhegan, Me.

Food and Dairy Commissioner Barney, of Iowa, has incurred the wrath of the makers of stock foods in attempting to collect from each an annual tax of \$100. One concern has begun an injunction suit, alleging among other things that the law under which the commissioner acted is in conflict with the constitutions of the State and nation.

A press dispatch from Hudson, Me., under date of November 23d, tells of the death of two men from drinking wood naphtha.

Obituaries.

DR. WILLIAM MUIR.

Dr. William Muir died at his home, 356 First street, Brooklyn, November 24th, aged sixty-one years. Dr. Muir attended the annual meeting of the New York State Pharmaceutical Association held at Thousand Islands late in June and, as was his custom, began his regular summer vacation at the close of the meeting. It was while away from home in July that he became ill, and for months he had been suffering from the effects of pneumonia combined with cardiac disturbance. His passing takes from the ranks of pharmacists in Brooklyn their most aggressive and conspicuous leader, removes from membership in the New York State Pharmaceutical Association a man who devoted a large part of his time to solving its legislative problems, and will deprive the meetings of the National Association of Retail Druggists of one of their most striking figures. Perhaps no single man in the State

WILLIAM MUIR, PHAR. D.

had so wide a personal acquaintance with pharmacists, wholesale druggists, manufacturers, legislators and the publishers and editors of pharmaceutical journals: Dr. Muir was a perennial and indefatigable worker for pharmacy, and as he always seemed to have plenty of time, he did not carry on his campaigns for the various purposes he strove to accomplish through secretaries and correspondence, but by coming into direct personal touch with the men whom he desired to enlist in the causes for which he worked. He also met his opponents, of whom he had more than a few, face to face, being a fighter who could both give and take heavy blows in the open, but lacking in that finesse which enables one to win by subtle and artful means.

William Muir was born at Glasgow, Scotland, in July, 1850. When he was only a lad his parents came to this country and settled in Brooklyn, bringing him with them, of course. The boy went to the public schools and when ready to begin his practical business education, took a place in the drug store of Dr. J. D. Farwell, Joralemon and Court streets. He soon had progressed far enough to matriculate at the College of Pharmacy of the City of New York and, later, to receive his diploma from the hands of President George C. Close, of that institution, as one of the eleven members of the graduating class of 1870. About the time of his graduation his employer opened a store at Broadway and Fourth street, New York, and in this he worked for a considerable period of time.

Later he clerked for Charles W. Kitchen, at Fulton and Washington streets, Brooklyn, and for William Vincent, of the same city. In 1884 Mr. Muir went into business for himself at Bedford avenue and South Second street, Brooklyn. Two years later he moved to Broadway and Gates avenue where he remained until June 14th, 1898, when he sold the business to Harry Balzhizer. Since that time he had not been actively engaged in the drug business, it being understood that he retired with a competency.

Dr. Muir was always a strong organization man. As a young man he was one of the founders of the Alumni Association of the College of Pharmacy of the City of New York, and, according to a story once current, he was, more than any other one man, responsible for the formation of the Kings County Pharmaceutical Society. This is the story: In 1876 or '77 a movement was on foot to organize a 'German druggists' association, for social purposes, in Brooklyn. Mr. Muir heard of this plan, and also heard that the organization was expected to take place on the Thursday night of that week at a Brooklyn beer place. The young drug clerk immediately went to see Henry J. Menninger about the matter, Mr. Menninger at that time being very prominent in the affairs of the New York college. They made up their minds that they could benefit the college a great deal by organizing a Brooklyn association, so each bought a hundred postal cards and wrote to the Brooklyn pharmacists, Mr. Menninger to those in South Brooklyn, and Mr. Muir to the balance, asking them to come to a meeting the following Thursday night, at Zipp's beer place. Those who had been planning the German association, upon receiving the postals, thought, as the dates were the same, that the call was a part of their own plans, and that a change in the meeting place had been made. Nearly a hundred druggists were present. The name adopted was the Long Island Pharmaceutical Society. Gustav Ramsperger and William Vincent, both good New York college men, were elected president and vice-president, respectively. There was much talk at the meeting of taking some steps to have the New York city pharmacy law extended so as to cover Brooklyn, when a member arose and asked, "What's the matter with Brooklyn going on its own hook? Are we going to be tacked on to New York forever?"

So in July, 1879, the first Kings County Board of Pharmacy was organized. Dr. Muir became a member of that board in 1894, and remained in it until the Greater New York board, of which he was also a member, took its place in 1898. The latter board, in turn, gave way to the all-State board in 1901, and Dr. Muir was transferred to the latter. He remained a member of the State board until August 1st, 1910, when it went out of existence under the pharmacy law of that year, to be succeeded by one appointed by the regents of the State University. The State pharmaceutical association recommended Dr. Muir for appointment as a member of the new board, giving him next to the highest vote received by any of the twenty-five candidates whose names it presented to the regents. Dr. Muir did not receive the appointment, however, nor was he any more successful this year, when his name was again presented by the association for the regents' consideration. It has been suspected that the new law putting the appointment of board members into the hands of the regents was passed largely as the result of efforts made by those who desired to get Dr. Muir off the board and were unable to accomplish this purpose so long as pharmacists had the choosing of that body's membership. Dr. Muir was elected vice-president of the old board in 1908 and its president the following year.

But, to get back to the Kings county society, with which Dr. Muir was most intimately associated, it may be said that as the old leaders died or retired he came into more and more prominence, and in 1896 was elected its president, an office which he held one year. Perhaps one of the stormiest scenes ever witnessed in that society's rooms, if not in the rooms of any other pharmaceutical organization in this country, was enacted during Dr. Muir's incumbency of the presidential chair. Dr. R. G. Eccles had resigned as a member of the society on account of differences between him and Dr. Muir as to certain matters concerning the Brooklyn College of Pharmacy. He subsequently had asked to be allowed to withdraw his resignation, and warm debates as to the parliamentary status of the case had ensued. At the meeting held in November, 1896, there were present enough pro-Eccles men to have voted to reinstate the Doctor had the matter come to a ballot.

However, when a motion was made which would have tested the relative strengths of the two opposing factions, the chair, Dr. Muir, refused to put the motion before the house on the ground that it was out of order. An effort was made to get the point of order before the house on appeal from the chair, but the chair refused point-blank to countenance it. In the uproar which followed, a vice-president undertook to lay the appeal before the house, but unsuccessfully. He was later expelled from the society—but not ostensibly for his action on this occasion. Dr. Eccles and his majority left the meeting room after the session, whipped, and by one steadfast, iron-willed man who, evidently subscribing to the doctrine that necessity knows no law, and deeming the permanent exclusion of Dr. Eccles from membership in the society a necessity, had taken things in his own hands and won the day by his own immovability and dogged determination. From that time until the day of his death no one ever openly opposed the will of William Muir in matters pertaining to the conduct of the society or the college—those who were unwilling to be governed by his wishes simply staid away from the meetings or kept their own counsel. And, be it said to his credit, there is perhaps no stronger or better organized local pharmaceutical association in America to-day than the one which he did so much to build up.

Due to the incessant efforts of Dr. Muir more than to any other cause the Brooklyn College of Pharmacy, owned by the society, has grown from merely an idea twenty years ago to a large and flourishing institution owning a building and equipment valued at something like \$100,000. As a result of his labors the college, in 1897, gained legislative permission to grant the degree of doctor of pharmacy, and he was one of the first to receive it.

Dr. Muir joined the New York State Pharmaceutical Association in 1896, and made his influence therein felt so soon and so positively that he was a strong presidential possibility at the Manhattan Beach meeting held the following year. Fervid caucusses were held by those who did not wish to see him at the head of the organization, and to defeat him they secured the renomination—equivalent to an election—of President R. K. Smither, of Buffalo. Next year, at Rochester, Dr. Muir was elected without any considerable amount of opposition. He had always been a power to be reckoned with in the State meetings since he first appeared at them, and the amount of work he has accomplished for pharmacists in this State, principally as the actual or acting chairman of the association's legislative committee, will perhaps never be fully realized. As a token of their appreciation of his services in their behalf, the druggists of both his local organization and the State association have presented him with gold badges.

Dr. Muir was one of the founders of the National Association of Retail Druggists, having been a delegate to the organization meeting held at St. Louis in 1898, both from the New York State Pharmaceutical Association and the Kings County Pharmaceutical Society. He attended every meeting of the national association from the time of its organization up to and including that held last year, and while he was never honored with high office by that aggregation of his fellow druggists, he was always on hand at its sessions to do whatever he could to protect the interests he represented.

Dr. Muir joined the American Pharmaceutical Association in 1907, but did not take the interest in its meetings that he evinced in those of other pharmaceutical organizations of which he was a member. Perhaps it was a matter of temperament with him—perhaps the comparatively quiet and dignified manner in which the American Association conducts its meetings did not appeal to his love of strenuous action. But when the association wanted to raise money for its Procter fund, it selected Dr. Muir to look out for the New York territory. Indeed, raising funds was one of his specialties, whether the object was to entertain a State meeting at Brighton Beach, or some equally worthy cause.

The deceased is survived by a daughter, who usually accompanied him to the State and national meetings, and by a brother and a sister. He was a Mason and attended service at Plymouth Church (the old Beecher church), and funeral services were held first by his lodge at his late residence, and then at his place of worship.

A. K. FINLAY.

Alexander Kirkwood Finlay, of New Orleans, La., died October 20th, at the age of sixty-eight years. He was a

native of Ireland, and long a resident in the Crescent City. For many years he had a store at the corner of Camp and Julia streets, and later operated a prescription laboratory in the Medical Building on Baronne street. His reputation as a pharmacist was country-wide. He retired from active business ten years ago.

Mr. Finlay was a member of the first Louisiana Board of Pharmacy, serving on that body from 1888 to 1893, several years as president. He was one of the organizers and first vice-president of the Louisiana Pharmaceutical Association in 1882, and its president 1885-6. In 1883 he assisted in the organization of the National Retail Druggists' Association and was elected as a member of the first executive committee. Later he became a vice-president of the organization. Mr. Finlay was a life member of the American Pharmaceutical Association which he joined in 1883. He was elected to the presidency of the association in 1890.

J. W. PERKINS.

John W. Perkins, of New Rochelle, N. Y., died November 1st, aged ninety-one years. He was born at Weld, Me., and at the age of sixteen went with his parents to Farmington where he became an apprentice in pharmacy. In 1840 he went into business for himself, removing in 1852 to Portland where the business was continued under the firm name of John W. Perkins Company. He retained the presidency of this company which developed a wholesale business, but retired from active commercial life in 1895, taking up his residence at Elmira, N. Y. He removed to New Rochelle ten years ago.

Mr. Perkins was a prominent Mason, being a Past Grand Eminent Commander. He is survived by his second wife and two daughters.

WALTER WYMAN, M. D.

Dr. Walter Wyman, surgeon-general of the United States public health and marine-hospital service, died November 21st, aged sixty-three years. He was a native of St. Louis, Mo., and had been in the marine-hospital service thirty-five years. He was appointed surgeon-general nine years ago. He was graduated with a bachelor's degree by Amherst, and took his medical degree at the St. Louis Medical College in 1873.

J. F. COWEE.

James Farwell Cowee, of Troy, N. Y., died October 31st, aged sixty-seven years. He was a native of Troy, the son of a member of the firm of John L. Thompson & Sons Company, and became druggist for that firm in 1864. Five years later he was admitted as a member of the firm and at the time of his death, was its president.

The following are the recently reported deaths of other persons in the drug world:

WILLIAM C. BISHOP, formerly of Omaha, Neb., at Long Pine, November 5th, aged fifty years.

F. F. BRIDGEWATER, of Raritan, N. J., at Somerville, November 14th, aged fifty-five years.

MOSES H. BUCHANON, of Nashville, Tenn., at El Paso, Tex., October 22d, aged thirty-five years.

Dr. ROBERT D. DASHIELL, of Princess Anne, Md., at Salisbury, November 11th, aged sixty-one years.

EDMUND ENTWISLE, formerly of Washington, D. C., at Wakefield, Va., November 11th, aged forty-five years.

HENRY N. FENDERICH, of Pittsburgh, Pa., November 8th, aged sixty-six years.

WILLIAM GILBERT FOWLER, of Brooklyn, N. Y., November 10th, aged sixty-two years.

DAVID HARPSTER, of Toledo, Ohio, November 17th, aged seventy-four years.

GUSTAVE HEERBRANDT, of Brooklyn, October 29th, aged sixty-four years.

CLAY C. LEEK, of Terre Haute, Ind., October 25th, aged sixty-seven years.

Dr. H. YERKES LONGACRE, of St. Charles, Ill., October 19th.

D. K. MAYES, of Tulsa, Okla., October 17th.

CLIFFORD AUGUSTUS POUCHER, of Brooklyn, N. Y., November 19th, aged twenty-nine years.

CORNELIUS J. ROTH, of Detroit, Mich., October 24th, aged twenty-nine years.

L. C. RUCKER, of Hugo, Okla., November 10th.

THEODORE RUNGE, of Tri-Cities, Mo., October 20th, aged thirty-five years.

JOSEPH MAX SCHMITT, of Rochester, N. Y., October 23d, aged fifty-seven years.

CHARLES H. STEIN, of Brooklyn, N. Y., November 9th, aged forty-six years.

EBENEZER THOMPSON, of Georgetown, Ky., November 4th.

CHARLES W. WARD, of Rutland, Vt., November 16th.

GEORGE WILCOX, of Braddock, Pa., October 22d, aged thirty-eight years.

JAMES WOOD, of Brooklyn, N. Y., November 4th, aged eighty-seven years.

Mrs. Kate Kellogg Merrell, widow of the founder of the J. S. Merrell Drug Company, of St.-Louis, died in that city, October 25th, aged eighty-four years.

Author of the Coudry Bill in Trouble.

Harry M. Coudry was arrested in this city in November on a charge that he had used the United States mails for fraudulent purposes in connection with some insurance scheme. He was taken to St. Louis, where he gave bail.

Mr. Coudry was formerly a member of congress, in which capacity he distinguished himself by introducing the most absurdly worded bill, perhaps, that ever got into print, calling upon the United States government to publish the Pharmacopœia. The CIRCULAR had something to say about him at the time (see the issue for February, 1910, page 49), and called attention to the fact that he was president of the company which made labordine, a "purely vegetable antipyretic" prior to the passage of the law against lying on the label, and an acetanilide mixture after that mislabeling statute came into effect.

New Stores.

Following are recently reported new ventures into the retail drug business:

Charles Silvers, at Portland, Ind.

Mr. Fink, at Woodcliff, N. J.

G. C. Hendricks, at Allentown, Pa.

The Rowe Drug Company, at Baldwin, Kan.

The Winship Drug Company, at Mansfield, Mass.

The Auclairs, at Norwich, Conn.

Brewster & Whitney, at Corinna, Me.

Mrs. Mary Jerome, at East Islip, N. Y.

C. E. Robinson, at Charles City, La.

J. H. Coutourier, at Covington, La.

James & Darden, at Gainesville, Ga.

N. G. Landon, at Parksville, Conn.

H. J. Fisher, at Holland, Mich.

I. M. Hodgkins, at South Connellsville, Pa.

Mr. Dawson, at Beallsville, Pa.

Adin French, at Peabody, Mass.

Powell & Smith, at Millville, N. J.

Bradford & Meadows, at Columbus, Ga.

L. W. Hensyl, at Shamokin, Pa.

Green & Clapp, at Northampton, Mass.

When Legislatures Meet.

To paraphrase the Farmers' Almanac: About this time begin to watch for legislative activity; hence the usefulness of the following time-table of approaching legislative sessions:

Congress: December 4th.

Georgia: June 26th.

Kentucky: January 1st.

Louisiana: May —.

Maryland: January 3d.

Massachusetts: January 3d.

Mississippi: January 2d.

New Jersey: January 9th.

New York: January 2d.

Rhode Island: January 2d.

South Carolina: January 9th.

Virginia: January 10th.

He (coaching his nerve): "Miss Comeleigh, may I call you Alice?" She (waiting): "I suppose you may if you really wish to, only—my name is Gladys."—A waif.

Philadelphia Association.

At the November meeting of the Philadelphia Association of Retail Druggists a set of resolutions were adopted memorializing the mayor-elect in behalf of the appointment of a pharmacist as a member of the municipal board of health.

Another resolution addressed to Governor Tener was in support of the candidacy of L. L. Walton, of Williamsport, for reappointment as a member of the Pennsylvania Board of Pharmacy.

A very interesting discussion grew out of the reading of the report of the committee on commercial interests. The consensus was that apparently clerks were not sufficiently familiar with the prices of drugs and pharmaceuticals, and that consequently they were not qualified to price prescriptions. It was declared that in many instances proprietors were also lacking in this knowledge, and that it was partly due to this fact that so many drug stores were simply eking out an existence. Stores of this class, it was declared, were not only worthless to the owners, but detrimental to more up-to-date business men who were injured by the ruinous prices charged by others who did not know the cost of the ingredients in prescriptions.

A feeling prevails that the association should open an office in the wholesale district of the city, for the use of the secretary, that official to combine the duties of the recording secretary, the financial secretary, and the organizer. This question of changing the official family is still a moot one.

It is announced that for the other offices the nominating committee has selected the following candidates: President, Christopher Koch and D. J. Reese; vice-presidents, W. E. Lee, A. G. Keller, and Samuel Laskin; treasurer, G. W. Fehr; executive committee, W. A. Carpenter, F. R. Keller, W. E. Cline, H. L. Hetrick, Ambrose Hunsberger, G. T. Lambert, O. W. Sellers, Charles Leedom, C. W. Lindig, M. D. Allen, R. T. Blackwood, L. A. Dresbach, and F. S. Day.

Ownership of the Prescription.

Here is a prescription for a draft for my husband, says the lady customer; kindly renew at once; it is urgent. Impossible, madame, replies the urbane but conscientious pharmacist. The prescription is dated yesterday, and has already been executed. But I met the doctor just now at his own door, and he said, "Continue the potion." A verbal prescription! H'm! Madame, I'm afraid that can hardly suffice. Risky, very risky. But my husband has a bad attack, and the doctor is away until to-morrow. That is his right. Then why did you stamp this paper and return it to me? Because it is your property. My property! And of what use is it to me, then? It has, madame, a purely historical value. You might have it framed. Your bridal wreath is your property, but how religiously you preserve it under a glass case! You use it no longer—yet it is yours. This prescription comes under the same category.—From the French.

National Association of Pharmacologists.

At a meeting of the executive board of the National Association of Pharmacologists held October 31st, a resolution was passed asking for suggestions for a new name for the organization that would be better indicative of the calling of drug clerks who constitute its membership.

Another resolution called upon every drug clerk in the country to work for better conditions for drug-store employer and employee.

Communications were received from the governors of twenty-two States commending the association's work for the appointment of clerks as members of boards of pharmacy.

Some five years ago a South Dakota bank cashier, who occasionally dabbled in chemistry, began to place each night a bottle of solution of formaldehyde between the doors of the bank vault. Recently his ingenuity was rewarded, for the fumes of the liquid repulsed a pair of cracksmen who had blown the safe—and also the bottle—with nitroglycerin.

The pharmacopœia committee of the General Medical Council of Great Britain has appointed Dr. Nestor I. Tirard and Prof. Henry G. Greenish as editors to supervise the work of preparing a revised edition of the British Pharmacopœia.

DRUG STORE MERCHANDISING

Booming Business by Bulletin.

Old-Time Bulletin Boards Almost Out of Date, but There Is a Large and Fertile Field for Some Improved Styles—Hints and Suggestions About Making Them.

BY VICTOR LAURISTON.

Have you, Mr. Druggist, ever used the bulletin board as a business getter?

The bulletin board isn't entirely a new idea; but in its most profitable phases it is new. It is to the window display what a store paper is to regular advertising.

THE OLD-TIME KIND.

Visit any country store—and, for that matter, some city stores on back streets—and you'll find the original bulletin board. It is a double blackboard, hinged at the top, standing on the sidewalk in front of the store, shaped like the letter A. On each face is chalked a badly blurred and rather indistinct list of "special bargains." The writing may be fresh, or may have braved the weather for weeks.

This is the original bulletin board, still popular with small grocery stores, and frequently seen in front of city free-lunch emporiums. Traffic regulations in larger centers have tended to put the sidewalk bulletin out of existence.

In some stores where there is plenty of outside wall space the blackboard is nailed to the wall, or attached to a corner pillar. Sometimes it stands in the doorway. There is this advantage about the blackboard bulletin: comparatively little labor is required to change an item on it—just a trifle of elbow grease, a rub or two with a cloth, a minute's scratching of the chalk, and combs can be converted into cigars, or curry powder into cod liver oil. But, on the other hand, there is the probability that the blackboard will not stand the stress of wet or even windy weather; the writing in the best of weather rapidly becomes indistinct; and when, with age, the blackboard turns gray, there is little contrast between the writing itself and the background, so that the "specials" on it do not show up as well as all good "specials" should.

BULLETINS ARE FOR SPECIALS.

The bulletin has a theory behind it. Most merchants never think of the theory, but it is much the same as the theory which causes the newspaper publisher to paste up in the window the startling announcement of the murder which has just occurred. "Get the news to the public at

once" is the axiom of the newspaper man, and "Get the news of bargains to the buyers at once" is the principle behind the store bulletin board. Theoretically, the store bulletin corresponds to the "extra" issued by the newspaper. It supplements the trade news contained in the regular newspaper advertisement and in the more carefully prepared window display.

So that when the druggist posts up a business bulletin, he is doing it in order to call attention to something special, which he hasn't had time to announce through his regular mediums of publicity.

Following the newspaper idea pretty closely is the pasting of special announcements in the window. Thus, a telegram announcing a large shipment of some special line of goods, together with the prospective date of arrival, is often pasted up. Or, when Saturday specials are announced in Friday's paper, the advertisement is clipped out and a copy pasted in each show window.

BULLETINS BY CARDS.

One rather attractive bulletin idea was the pasting of a row of cards in the show window, horizontally, on or a little above the level of the eye. Each card referred to some seasonable article, giving a few words of explanation, together with the price. The cards did not interfere with the view of the regular window display. Even at that, however, they probably did a little toward spoiling the effect; though in cases where such bulletins deal with the lines featured in the window display itself they prove helpful to the latter.

With such bulletins there is always to be considered the added work of cleaning the windows afterward. Occasionally the "stickers" used in affixing them may be difficult to remove.

BULLETINS A LA NEWSPAPER.

Probably the best and most effective bulletin system is one closely modeled upon the news bulletins used by the big dailies in our large cities. Outside the newspaper offices commodious bulletin boards are erected, or bulletin frames constructed. The boards are covered with white paper, and on this a brief summary of each important item is written as it comes in over the wires. In some cases the bulletin is written on a sheet of paper in the office and afterward pasted on the board. In other cases a series of separate boards is used, each about a foot square, with hooks attached; and these, with bulletins written on them, are hung in the frames.

Adapted to trading purposes, this system usually takes the form of a large bulletin board, usually attached (vertically) to the corner of the store, or to a pillar at the en-

trance. One or more such boards may be used. On this board are pasted announcements of new lines of goods just received, or notices calling attention to special lines of stock. The average-sized bulletin board will give room for from six to a dozen announcements, the number depending upon the size of the lettering. These items can be changed whenever desired, and should be changed frequently.

WRITING THE ANNOUNCEMENTS.

White paper, with red or blue ink, should be used, the most convenient method being to write the posters first and paste them up afterward. The writing is best done in vertical, legible letters, without any attempt whatever at ornament or flourishes. The changing of the bulletins is rendered more convenient by having all the sheets used of the same size, so that any one may be removed or pasted over without disturbing the others. The sheets need not be large. A letter-size sheet for each bulletin is usually sufficient. The main thing is to have legible writing. The presence of the bulletin board in a prominent position, coupled with the words "extra" or "special" at the top of the column in flaring letters, is a sufficient invitation to the passerby to stop and take a closer look at the smaller-lettered announcements. Most people will form the habit of halting for a glance at the bulletin, which thus becomes a cheap but valuable medium of publicity.

Here and there, instead of a board with pasted bulletins, a slide system is used. The board takes the form of a frame, with spaces into which cards may be inserted. This is a quicker method, and saves the work of constant pasting, though, unless the frame is well constructed, there is danger that the cards will be dislodged. The higher price of stiff cardboard also merits consideration.

WHAT TO SAY ON BULLETINS.

What is to be bulletined? For one thing, the bulletin man should not tie himself down to mere prices. He should never forget the price, but should not make it the sole feature. This applies to every form of bulletin, whether written on a blackboard or stuck in a widow or pasted on a board.

An entire sheet of paper should be used for each article featured. Each article should be introduced with a catchy, descriptive, epigrammatic phrase, emphasizing some worthwhile selling point, and wind up with the price. Practice and mental effort will give one the knack of "hitting off" the good qualities of a new line of combs in ten or fifteen words, or arguing convincingly regarding a Saturday cigar special in the same limited space. If an important shipment has just arrived, attention should be called to that fact. If some line is moving too slowly, it may be jacked up with a few terse but effective words on the bulletin board. For not only is the bulletin board an effective means of introducing new goods, but it is a splendid method of waking the slow sellers into new life.

In short, the bulletin board should be a vehicle for carrying to the public at the earliest possible moment the newsy news of one's business. It does not take the place of newspaper advertising or of a window display, but it supplements both. News value—from a business point of view—should be the vital essential of every bulletin posted.

THE BULLETIN BOARD AT NIGHT.

As a rule, the bulletin board at night is put out of commission by the darkness, and this at the very time when crowds are thickest upon the streets. An incandescent bulb, properly shaded and protected, at the head of the board, will remedy this difficulty at slight additional expense.

Does the bulletin system pay? Well, that depends largely upon the amount of brains mixed with the paste and ink and paper. The well-written bulletin, like the well-written show card and the well-written newspaper advertisement, is always a business getter. The striking bulletin board—the one which is gotten up with some novelty—is bound to attract attention, anyway. It is still a new and exceptional thing, and for that reason, if for no other, it invites the passerby to stop a moment and take a closer look.

What a lovely calling the drug business would be if there were no such thing as "dead stock." Dead stock, like other dead things should be disposed of. The wise dealer finds some way to get shut of it—ask the successful department store proprietor.

Shaving Supplies a Profitable Side Line.

How to Buy, Display, Advertise and Sell Them Told by
a Man Who Knows Because He Has Demonstrated the Efficiency of His
Methods.

By ROBERT RECTOR.

In these days of sharp competition most druggists are forced to rely, to a great extent, on side lines as profit producers. Naturally the question arises, Which side lines are the most profitable?

Our experience has been that a well-selected line of shaving supplies allows more opportunities for sales, and pays better than any of the various lines we carry.

Brother druggists, just look at the field. Practically every man that enters the store is a "prospect." Go after him. Don't wait for him to ask about your goods. Suggest! Suggest! Maybe he doesn't need a new razor, but when you mention razors it reminds him that his old brush is shedding and a new one is in order.

Has he tried the new shaving creams that are being so highly advertised? No, but he has been thinking of doing so, as they seem more convenient than the old-fashioned mug. Perhaps he has a strop, but you can interest him in one of the new "honing strops" that give a keen edge with two or three strokes of the razor.

He may say that he "never could handle a razor." He is the man that will buy a "safety." Explain that with one of these tools, he couldn't cut himself if he tried, and that with a little practice he can shave himself with the skill and ease of an expert. Let him know that he can always get new blades at your store when he needs them, and call his attention to the new automatic stropper, that quickly puts a new edge on old blades. No skill is required to use it and it is more economical for him to sharpen the blades himself. After shaving he will need a bottle of your face lotion; and most shavers use talcum too.

We get behind this line strong. Except during the busy hours, we mention the line to nearly every man we serve, and it would surprise many druggists to know the number of sales that can be picked up merely by calling attention to the line when handing the customer his change.

We employ four clerks in our store. In one day, alone, we sold twenty of the \$1 safety razors, and several of the buyers took along complete outfits.

As it is an easy matter to gain the attention of a woman by showing her an article designed to beautify her, so also are most men interested in anything that will add to their shaving comfort. They are glad to have their attention called to the new articles that are constantly coming out. If tact is used, very few men will resent the druggist's efforts to make a sale. Show the goods, talk them intelligently, and suggest that the customer try them, but never "tease" him to buy.

Give a front show case to the line and if you carry newspaper space, give the line an occasional ad. The different manufacturers are always glad to furnish free electrotypes.

Handle standard goods only and make a specialty of the new advertised articles as they are put on the market. Handling the new things never fails to give a store prestige.

We make a profit of 100 per cent. on all old style razors, sell them under a guarantee, and replace any that are unsatisfactory. The makers in turn stand behind us. Safety razors, while not so profitable, pay well. The popular \$1 kind are more easily sold, of course, than the \$5 brands, but a goodly number of the higher-priced ones are also sold. The sale of extra blades, too, is quite an item.

We try to handle a complete line of accessories, such as strops, shaving soaps, powders and creams; brushes, mirrors, mugs, hones, automatic stroppers, lotions, etc. We have a splendid trade on the entire line and attribute our success to the enthusiasm we have enlisted among our sales force.

The drug store is the logical place for this line and any druggist with push and energy can do well with it.

Automatic stamp-vending machines ought to do much toward solving a problem which has confronted the druggists of two or three generations.

Holiday Advertising.

The Holiday Buyer Is a Fertile Field for the Advertiser—Druggists Have Scores of Gift-Potentialities in Stock—Some Hints Anent Advertising Particular Lines.

By M. P. GOULD.

There is no other time during the year when so much attention is paid to retail advertising as during the holiday season. Therefore, it behooves every progressive druggist to stretch his advertising appropriation to the limit during the month of December in announcing all seasonable wares to prospective customers.

In advertising Christmas goods, it is well not to overlook the fact that other goods than gifts are sold during December; and it should be the purpose of every retail druggist to take advantage of this and to see that his advertising during December produces sales for his regular stock as well as his special Christmas goods.

There is no time so advantageous to advertising as the time when the public is buying. It is a funny thing, but nevertheless, it is true, that when men or women get in the habit of buying, they purchase goods which they would not think of purchasing at any other time. My attention has been called very frequently and forcibly to this fact by retail druggists who have had opening and anniversary celebrations. When such celebrations are had, the druggist usually spends considerable money in advertising, in decorating his store and in other features, which bring great crowds of people to his store. And I have had letter after letter from such druggists telling me that it was surprising the amount of old stock which was sold; that the celebration afforded an opportunity to dispose of goods of a sort not before sold for years. This is one of the reasons many druggists who have had a big anniversary or opening celebration usually conduct a similar affair annually thereafter.

During the holiday season every retailer who has holiday goods for sale, and practically every retail druggist does have such goods, should produce advertising of a character that will arouse enthusiasm. He should word his advertising in a way to give the impression that the holiday season is a great big gala festival of Christmas goods buying. In other words, he should endeavor to create the impression in the minds of the people that there should be only one purpose during the holiday season and that purpose should be to buy, buy, buy.

THE SELLING PLAN MUST JIBE WITH THE ADVERTISING.

No matter what the advertising is, what the plan is or the exact style of copy used to carry out the plan, it will not be successful in a big way without the most careful co-operation on the part of the entire store. Not simply co-operative efforts by the proprietor, but co-operation on the part of every man or woman in the store. The window trims must co-operate with the advertising. The show case displays must assist along the same lines. Show cards should be used in the windows and in every available corner of the store—cards as forcibly written as it is possible to write them. They should be made to advertise the goods which are displayed and these goods in turn should be the same goods, as far as possible, which are advertised.

It is easy to see where the advantages of co-operation come in. Suppose a customer, reading the announcement of Christmas goods, the advertising of various goods in the store, comes to the store and asks for certain goods and finds that the clerk is almost totally ignorant of those goods; or another, seeing special prices quoted for

certain goods comes to the store and finds that the clerk not only knows nothing of these prices, but when told that the goods were so advertised, looks embarrassed and must consult the proprietor while the customer waits—perhaps. This is a good illustration of much of the waste in advertising which goes on day after day in the drug store simply because careful co-operation is not practiced. Compare a customer's valuation of a store's service in such a case as this with that based on a visit to another store where the goods advertised are displayed prominently on the show cases and on the counters, with show cards bearing exactly the same prices as are indicated in the advertising. Compare the first store with the store where the clerks are all familiar with the prices and advertising which has gone to the prospective customer. In the latter case, the customer leaves the store satisfied; leaves the store feeling that it is a modern store; that it is endeavoring to serve its customers in an intelligent way. A good impression has been created; whereas in the case first mentioned the advertising is practically of no value except in the individual sale which perhaps has been accomplished.

In the first mentioned case, the customer probably finds what she goes after, but the chances are that she buys nothing else. In the other case, she is so well pleased with the entire atmosphere of Christmas buying that she is very liable to shop around from table to table and from show case to show case, and doubtless will leave the store with many more purchases than she intended to make when she came in.

ADVERTISING METHODS.

It is unnecessary in this article to go into the various ways of advertising a store at Christmas time. Every druggist who has the interests of his business at heart has studied the question of advertising. He knows the method of advertising which in his individual locality produces business better than any other method. When the holiday

(Name and address)

season comes around and he has loads and loads of goods in his store which he wishes to get off his hands, he naturally turns to the advertising methods which past experience has taught him are the most successful. In some local-

ities it is newspaper advertising; in other localities, the druggist has learned that he cannot depend exclusively on his newspaper space, but must have something which works with it, so he divides his appropriation, one-half for newspaper advertising and one-half for good, big, business-like circulars. These circulars he distributes throughout his locality at the time his advertising is appearing in the newspapers, and in this way he hits two blows at the same time. Again, there is a chance that the druggist is so located that he cannot possibly get the benefit from more than one-half or perhaps only one-third of the circulation of the newspaper; and in some cases he finds it useless to depend upon the newspaper. The space costs him entirely too much money for the proportion of circulation advantageous to him. He has learned from experience that circulars will produce results; not ordinary circulars such as he might distribute during the month of July or the month of October, but good, big, beautiful, happy Christmas circulars whose theme is holiday buying. Other druggists possibly rely upon circular letters, but circular letters at Christmas time cannot answer the purpose. Such advertising may do for certain goods at certain times of the year, but the buying public demands more life in advertising at Christmas time. The druggist depending upon letter advertising during the holiday season is not liable to get any great results from his advertising.

ONE VERY SUCCESSFUL WAY OF SELLING CHRISTMAS CANDY.

One successful retail druggist, a good old friend of mine, located in a town in eastern Pennsylvania, for many years has used the plan outlined below for advertising Christmas candy, and from the very fact that he has kept to it year after year for the past decade, is proof enough to me that the plan is successful; therefore I am going to make you acquainted with it.

Instead of advertising candy in the newspapers (which by the way he uses regularly) he used a very tasteful

and appropriate folder. This folder is mailed to all of his customers in the first two weeks of December. It announces the fact that he will take orders for candy to be delivered at any time the customer indicates.

He advises that the delivery be made the day before Christmas. The reason given to his customers for his taking orders in advance is a splendid one. It is that he files all of these orders, and at the last moment rushes an order for the total assortment by wire to the manufacturer; and the candy is shipped directly by the manufacturer to his store and immediately delivered to his customers. By so doing, he insures to his customers the very freshest candy that can be obtained. He informs his customers that the candy can be had in one-pound, two-, three-, or five-pound packages. As the candy that he advertises is an expensive brand, and as the orders which he receives are enormous, it is easy to see that his profits on Christmas candy are large.

Of course the sending out of this circular not only influences orders for his Christmas candy, but it stimulates the sale of all his candy during the month of December. The handling of candy in this way makes his store headquarters for the better grades of candy during the entire year from one Christmas to another. It certainly is an excellent method of advertising; and it most certainly is a method which must please his customers. It is a plan which would be hard to improve upon and a plan which I certainly should suggest to any druggist who is desirous of increasing his candy business and getting a reputation as the store from which the highest class candy can be secured.

PHOTOGRAPHIC ADVERTISING.

One retail druggist whom I have in mind has been very successful in creating an enormous camera and photo-supply business. His methods are rather unique. He advertises that if any person who is thinking of purchasing a camera, and is not acquainted with picture taking, will notify him to that effect, he will send a representative to call at that person's home with a camera and accessories to teach the prospective customer how to take and make pictures, exterior, interior and por-

PERFUMES

MAKE Rich, dainty, true
FINE flower odors—
GIFTS Nature's treasures
encased in crystal.

Perfumes make excellent gifts to anybody anytime.

Their daintiness appeals to the fastidious.

Their usefulness makes them gifts that last.

Their distinctiveness is demanded by "moderns."

Put perfumes on your list and rest assured you have done right.

Here's a very large line in rich packages for gifts—the fullest perfection in odors and a bottle that adds to their "fancy."

Cheap enough to give liberally.

Good enough to give anybody.

Early Christmas Shoppers get the cream of the selection

THE early buyer gets the choice. Christmas gifts you surely will give—and it is better to give appreciated, acceptable gifts. Such gifts you can get by selecting from our big stocks early, before the dilatory Xmas crowd comes shopping in a last-day hurry.

(Name and address)

traits. Instruction will be given in the developing of negatives, and prints from those made will be submitted to the prospective customer before he is asked to place the order for the camera. Many druggists would not care to go to this trouble, yet it is usually trouble (if you wish it to go by that name) of this sort that creates the good impression with the customer and in the long run makes a drug store the neighborhood headquarters for cameras and camera supplies. There are very few plans at all worth trying which are not worth trying well.

Whether this kind of a plan or some other is used, it is well for every retail druggist handling cameras and photo-supplies to remember that there is no Christmas gift which is quite so much appreciated or so acceptable as a nice photographic outfit. And as there is good profit in this side line, it certainly is advisable to advertise it during the holiday season.

CHRISTMAS PERFUMES.

It is not necessary to call the retailer's attention to the advisability of advertising perfumes, for every druggist who carries a line of perfumes usually has an additional Christmas line to be disposed of, and as the perfume line is one of the old Christmas standbys, the retail druggists long ago have realized the importance of advertising it. There is one point, however, which I wish to bring out as forcibly as I can while I have the opportunity to do so.

In some cities of America the perfume business has been taken almost entirely out of the hands of the retail druggists. In these cities the department store is every day becoming more and more the place where the great bulk of perfume and toilet articles are sold; yet only a few years ago practically the entire output to such articles was through the retail drug store. It is sad to think that this change has come about. It would not have come about so quickly or so thoroughly if the druggists had paid more attention to the stock they carried and to methods of advertising the stock to their customers. There are other lines which are fast following the perfume line. It follows that the way in which the druggist conducts his business and advertising has much to do with whether the department stores will be successful in winning away the trade in these lines also.

Every retail druggist reading this article should make up his mind that from this time on he is going to do everything in his power in the way of advertising, in the way of selecting, displaying, and selling his wares, to prevent any of his trade from being attracted to the department stores. This is a big problem, but it is a problem well worth solving, and the sooner it is solved, the better it will be for the retail drug trade in every community and for the drug trade in general.

CHRISTMAS CIGARS.

Women often say that they are puzzled when it comes to purchasing Christmas gifts for men. It is not so hard for women to purchase gifts for the men of their own families, although this is not an easy task, but it is difficult for women to purchase gifts for men who are friends; and suggestions are always welcomed. Every woman, whether she is young or old, knows that there is no gift which is

more appreciated by a smoker than a box of good cigars; still she is puzzled for she does not really know the brands of good cigars. So active have been the joke-smiths with the woman-selected-cigars theme that many women do not care to make a present of cigars unless positively assured that the cigars are good; in other words, that they will be appreciated by the person receiving them.

An Easy-Operating Picture Taker Is a Gift Worth Having

From one dollar to a hundred for a camera for everybody, baby to grandpa. An easy-operating, "a-child-can-do-it" camera gives a pleasure never reached with any other gift, be it a toy or a utility.

There is such a range of sizes and prices—all perfect picture takers—that you can afford to give cameras the preference in gifts.

Come; see one work; see the pleasing results, and the ease with which you get them—and then make a prominent place on your gift list for cameras.

If the "kid" owns a camera give him a gift of supplies—from our stock.

Buy a camera for yourself and enjoy a new phase of life.

(Name and address)

Druggists are acquainted with cigars. They know the good brands and the poor brands. It is a simple and inexpensive plan of advertising to get out a nice little holiday-suggestion folder and mail it to every woman in the store's territory—especially the young women, the entire folder to be devoted to cigars. The recipients should be informed that if they have any friends who are smokers to whom they would like to present a box of cigars, the druggist, having been acquainted with the facts will assist in every way possible to see that the man gets his favorite brand of "smokes." A folder of this kind, worded carefully, would undoubtedly produce a good impression and would sell many boxes of cigars. Not only would it sell cigars to the women to whom it was addressed, but in cases where there were men in the family, the folder would prove a good general advertisement for the cigar department, and would undoubtedly do that department an amount of good.

STATIONERY.

Fountain pens, ornate pen holders, papeteries and desk sets are articles which are sure to be appreciated as gifts. They can be advertised in the newspapers, or with circulars or folders.

The value of a great deal of Christmas advertising of this kind is the suggestion. As many men and many women have numerous people whom they wish to remember, suggestions are always welcomed, as it is much easier to select the gifts when one is at home than it is after arriving at the store.

BRUSHES.

Brushes, like perfumes, are one of the old standby lines which are very popular during the holiday season. They are easy to advertise, easy to display in the windows, and make an attractive showing in the show cases. The druggist has the opportunity of selling high-priced brushes at Christmas time; their appearance places them far above the cheap sort in desirability as a gift.

At Christmas time salesmanship counts for more than at any other time of the year. It is an easy matter for a real salesman to switch a buyer from a cheap article to a higher-priced kind; and of course no salesman should lose an opportunity to do this.

Advertising of brushes is a simple matter, when one keeps in mind the fact that brushes are very popular as Christmas gifts. There are many buyers who are interested in brushes who have already put them on their memorandum list as suitable for certain persons. Therefore, it is advisable that druggists put forth considerable effort in advertising his line of brushes to his clientele.

The *Chicago Tribune* has established a department of public health in charge of W. A. Evans, M. S., M. D., LL.D., P. H. D., former health commissioner of Chicago. In the announcement the public is told that the aims of the department are preventive not curative and that developed disease, justly and wisely, must be handled by the family physician. Right living will be the slogan in this new phase of newspaper activity which is a commendable departure from the usual exploiting of "prescription" nostrums and family-medical-adviser book learning.

Prof. F. X. Moerk, of the Philadelphia College of Pharmacy, has been appointed assistant dean of that institution.

Druggists to Aid Each Other.

There is no use in talking about it, constructive co-operation is fast displacing destructive competition.

For the purpose of getting better acquainted with each other and engendering a neighborly spirit of helpfulness, a number of suburban druggists in the Orange section of New Jersey met at the house of Garrett Byrnes, Maplewood, one evening about the middle of November.

"The changing conditions confronting suburban druggists," said Mr. Byrnes to a representative of the CIRCULAR, "make it imperative that we become better business men, giving much more attention to the merchandising of our goods than heretofore, and this we must do without expense to the quality of our professional work."

Continuing, he said: "How shall we do it? That is one serious and perhaps vital question for our organization to answer. I feel sure we shall find the solution. We shall probably hold two meetings each month, one for the consideration of professional matters and one for the discussion of trade topics. Our idea is not to attract a large number of druggists and have an unwieldy body; merely a drug circle of neighboring pharmacists is desired. Mutual helpfulness is more desired than a large number of names."

Maybe these changing conditions will cause druggists in other neighborhoods to get together for mutual assistance, and thus be a means of helping rather than hurting the business of the small stores.

It's a "Merry Xmas" to everybody who gets

A BOX OF

OUR CHOCOLATES

STOP your worrying—quit the bother—put "Chocolates" against every name on your gift list and you are bound to "hit it right." Everybody says "thanks" for chocolates. Chocolates? Give our chocolates in their pretty Xmas boxes and make somebody, everybody happy.

We do not carry them in stock but order them direct from the factory — on Christmas morn your candy gifts are presented "one-day fresh."
 I Won't "She" appreciate that kind of a "Merry Xmas"?

Candies for your choice.

Fresh from the factory; you take no chances. They have not lain around our store a month. Give candy, and avoid doubt. Give candy and win the appreciation of the recipient. Give candy—and buy a box for yourself.

(Name and address)

Musical Merchandise as a Side Line.

When wondering what side line he will put in to help him pay rent and clerk hire, or to defray part of the expense for gasoline and new tires for his whiz-wagon, the druggist might do worse than consider musical merchandise.

Harmonicas and banjo strings, accordions and violin strings, auto-harps and guitar strings, musical toys for children and musical instruments for adults constitute a line of merchandise which fits in well with the druggist's other stock of fancy goods. And there is good money in them, too, once the people begin to depend upon the druggist to supply their wants in this line.

Modern Drug Standardization is the title of a "working bulletin" recently issued from the laboratory of the H. K. Mulford Company, of Philadelphia. In it is set forth the necessity for the standardization, and the official methods are reviewed. Then follow extensive notes on the physiological standardization of digitalis, apocynum, convallaria, squill, strophanthus, aconite, gelsemium, and veratrum. The report of the committee on physiological standardization of the Philadelphia branch of the American Pharmaceutical Association is also included. A list of the house's standards, chemical, physiological, bacteriological, and physical, is appended.

Ed. Howe says, "Frequently you do not know, but you might find out oftener than you do."

Fire, October 30th, damaged heavily the summer home of Prof. J. P. Remington, at Longport, N. J.

Candy for Christmas.

Package Goods Are All the Go These Days, and for Valid Reasons Manufacturers Are Co-operating With Retailers to Boom a Business Which Affords Large Profits All Around.

There was a time well within the memory of some who are not yet willing to be called past their prime, when the selling of candy in a drug store was, to some extent at least, looked upon as a picayune and undignified part of the business—profitable, perhaps, in a way, but still not just what the druggist would have preferred if he could have had his “rathers.” Candy was sticky and “messy,” it attracted flies and roaches, it deteriorated rapidly in summer, and a good part of the profit went in down-weight or was nibbled off by the clerks and their friends—and all that.

But candy-making, and candy-eating have undergone as great a change since then as have the means of transportation in our urban and suburban communities, and with these changes there has necessarily come about another, a change in candy-selling. A dozen or a score of years ago candy—like soda water—was a line which appealed chiefly to children and the younger crowd. To-day candy-making is an industry which is practiced largely that grown-ups may be gratified; candy-packing and candy-advertising are branches of the business conducted by artists; candy-selling is a vocation worthy of the most earnest attention of the best commercial talent; and candy-eating is a pleasure confined to no age, sex, class, color or condition, but is indulged in by practically every man, woman and child in the country.

In bringing about this change, cause and effect have worked in a circle; better candy has created a larger demand, and the larger demand has made it worth while to manufacture more and better candy; the greater the number of eaters the more their trade is worth going after; the more the trade is gone after, the greater the number of people affected. Candy is now sold not only in confectionery stores, but in grocery stores, in toy stores, in department stores and, as of yore, in drug stores. The making of candy is a large—a very large—and growing industry; the eating of candy is a well-nigh universal custom. Then what? Just this: The distribution of candy, the passing of it from the maker to the consumer, must be attended to, and at a profit, by somebody (or, rather, bodies). Who is in the best position to handle this trade? The answer is so obvious that it will not be written here. People already are in the habit of running into the drug store for this and that, and so long as they are going to buy the candy anyhow it would be a convenience to them to be able to get it while out for a stamp, or to use the telephone, or to consult the directory, or to buy a glass of soda or a cigar, or to make any one of a hundred purchases which are necessary or desirable in every household almost constantly. And many a time when the customer had not intended to purchase candy, an attractive display of neat boxes of confectionery will induce him or her to part with the price and look pleasant while doing so. Box goods are not sticky or “messy,” they do not attract flies or roaches, they do not deteriorate so rapidly as the open kind, and when they do become a little stale the manufacturer will replace them with fresh goods, and they are not subject to the loss occasioned by too generous weighing or sampling. When fruit or vegetables are exposed in bulk they gather dirt, but fruit may be washed before it is eaten, and vegetables are usually sterilized by boiling. Meat and fish are laden with germs when they reach the kitchen, but these are destroyed by heat. Candy which is displayed in a show case in open trays and is handled by not over-tidy clerks, goes into the mouth just as it is received, dirt and all. Boxed candies do not gather dust in the store or come into contact with dirty fingers.

A stock of box goods, packed to attract the favorable attention of the most exacting, and assorted so as to catch dimes as well as dollars, may be well displayed in a show case occupying not more than two linear feet of counter space. As to the probable cost of such an assortment and the profit there comes from handling it, actual facts are more convincing than glittering generalities, so here are the facts:

Stephen F. Whitman & Son, who make an extensive line of fine candies, offer an assortment consisting of 63 boxes and 5 cartons which range in price from 5 cents a package

to \$1 a pound box, the assortment costing \$25.53 and selling for \$36.70, a profit of \$11.17, or about 44 per cent. on the investment. The Whitmans do not require their retailers to confine their stock to Whitman brands, but they seek to make their brands so attractive that the dealer will not wish to carry any other.

“Gunther’s” is a name which is associated in the minds of many lovers of sweetmeats with pretty packages of candy. A \$25 assortment of Gunther’s offered as a starter to those druggists who are not familiar with the line, consists of six boxes each of the ten kinds of candy, three boxes each of two kinds, and two cartons of 10-cent goods. The profit on this assortment is \$16.25, or 65 per cent. on the investment.

The Lowney Company’s label on candy packages became widely known through national advertising. At the request of the CIRCULAR this company has prepared a list of goods which might with advantage be ordered at one time by a druggist who has not yet built up a large trade in confectionery. It consists of six packages each of eight varieties of pound and half-pound packages, to retail at 60 cents a pound, three packages each of three kinds of higher-priced goods, five dozen 10-cent packages and six dozen 5-cent packages. The cost of this assortment to the druggist is \$24.70; the retail price \$40.20; the profit on the investment over 60 per cent.

For those who want to try a small order at first, the Collier Candy Company has a special introductory assortment of package goods which it sells for \$10. The retail price of these goods ranges from 60 and 75 cents per pound box, to 30 and 40 cents for ½-pound boxes, and on down to 15 cents for smaller packages, amounting in all to \$17.85—a profit of 78½ per cent. on the investment.

The wants of the druggists who wish to go strong on children’s trade have not been forgot. Rueckheim Brothers & Eckstein have an offer of fifty 10-cent packages, representing eleven varieties of goods, which they sell for \$3.25. While the profit on this assortment is only \$1.75, the investment is small and the rate of profit on it is large—about 54 per cent.

These are just examples of prices and profits. Of course any kind of assortment may be ordered by the druggist from almost any manufacturer. As a general thing the manufacturers pay the express charges on orders amounting to a certain sum, say \$20 or \$25, as it is to the advantage of the manufacturer for the retailer to order often and always offer fresh stock. The manufacturers, too, make a practice of taking back stale or otherwise deteriorated goods and replacing them with fresh packages.

Christmas shopping has already begun, but the candy for Christmas will not be bought until the last thing. There is plenty of time for druggists to lay in a supply of it for the holiday rush—but the \$25 assortment will be as inadequate to supply the demand as a hay rick is to withstand a Kansas cyclone.

Candy on the Side.

The side line which comes in most naturally to the bakery is confectionery, which many bakers have taken hold of within the last few years. Invariably candy, as a side line, shows a good profit, and, as a rule, is a most satisfactory proposition. The sale of confectionery over the counter is constantly increasing, and reports show that it will soon attain very large proportions. To you who have not tried it we would urge a step in this direction. Try it for yourself. You have showcases sufficient, and certainly one, or a portion of one, may be devoted to the display of dainty confections which will serve to excite the appetite, and later cause a purchase by the customer who comes to your store for bread, pies, or cake.—*Solicitor.*

The All-In-One Sundae.

Begin with a large dish, because this is no small affair. A little to one side of it lay the two halves of a large individually bisected banana, and on the opposite side place a fig and a stuffed date, flavored by pineapple cubes. At one end of the banana deposit a ladleful of ice cream, and at the opposite end arrange a sweet wafer and a few sections of an orange. On top of the banana drop a small portion of orange ice. Over the ice cream pour a ladleful of chop suey dressing, and over the orange sprinkle some grated cocoanut. If there is room left anywhere on the platter for a little whipped cream, add it, and if He doesn’t give up at least 20 cents, don’t let Her have it.

Building Up a Business in Christmas Toys.

How a hardware establishment in a small Pennsylvania city became known as "The toy store of the town," is told in the *Iron Age-Hardware*.

FIRST APPEAL TO CHILDREN.

The first appeal of the firm has always been to the children. "Get the children interested first in your toy department and their parents are bound to come," is its advice.

One year this house received a big shipment of toys a few weeks before Christmas and hit upon a clever idea to attract attention to its toy department. A delivery truck was sent to the railroad yards and Santa Claus superintended the work of taking the goods from the freight car and piling them on the wagon. The firm had advertised that at a certain hour on Saturday (this day being selected because it is a school holiday) Santa Claus would drive to the freight depot and bring up a load of toys. Children by the scores were at the depot to see Santa Claus, and by the time the toy wagon had reached the store a couple of hundred children were following it.

Signs on the horses and wagon read:

SANTA CLAUS HEADQUARTERS

at S. RECHER & GANSS' STORE.

THIS LOAD OF TOYS IS FOR

SANTA CLAUS at

SPRECHER & GANSS' STORE.

GRAND OPENING TO-DAY

From 2 to 10 P. M.

Another year Sprecher & Ganss sent Santa Claus driving around the city and surrounding country districts for days. Old Santa was seated on the chimney of a house

which was perched on top of a wagon. The house was a light frame structure covered with oil cloth and painted to resemble the dwellings that Santa visits on his rounds. This wagon visited the school houses at recess time and the children were much interested.

Every year they hold a grand opening of their toy department on a Saturday a few weeks before Christmas. The opening is held between 2 o'clock in the afternoon and 10 o'clock in the evening, and is always well advertised in the newspapers.

Another idea of this concern is to have all deliveries of Christmas purchases made by men dressed as Santa Claus.

A TOY FACTORY IN WINDOW THIS YEAR.

This year Sprecher & Ganss will have a special window demonstration of a Santa Claus toy factory. Santa Claus will be in the window all day long making toys. Such goods as express wagons, go carts, doll carriages and other toys that are shipped "knocked down" will be turned over to the show-window Santa Claus, who will assemble them in view of the people in the street.

For the Post-Holiday Week.

To take up where the holiday rush leaves off, to show the public that his entire energy was not consumed by attending to the wants of Christmas shoppers, to keep receipts from dropping off too suddenly, the druggist might arrange a tooth-preparations week early in January, or, indeed, between Christmas and New Year's. Maybe it would be better to put it off to January, as then the minds of the people will be turned to the more serious things of life and it will not be so difficult to attract their attention to and cause them to take an interest in the prosaic necessities rather than the frivolous luxuries.

In the first place, let the druggist look around and see what he has to offer in the shape of utensils and medicaments for the teeth and mouth. Of course tooth brushes will figure prominently in his displays as well as in his printed advertisements. If he puts up a tooth powder or mouth wash of his own, it should be featured conspicuously. Manufacturers of the various powders, pastes, soaps and liquids for the teeth are only too glad to place their wares before the public in a convincing way, and the one whose goods the druggist selects for special pushing will no doubt supply him with materials for a window trim and give him some concession on prices as well.

Christmas candies will have left a trail of aching teeth, and toothache drops, toothache gums, liniments and the like will be wanted. Over-eating will have caused indigestion and bad breath in many quarters, so that cleansing mouth washes will be needed. Even toothpicks, dental floss and the smaller items of this kind will lend themselves to the display, as will, of course, "peroxide."

Windows, show cases, signs displayed about the store, circulars sent by mail, newspaper advertising and other aids to business should be brought into requisition. The whole campaign should be well studied out and arranged in advance, and not pushed in a haphazard, hit-or-miss style. Every legitimate means to interest the people in the goods, to get them into the store, and to cause them to buy should be employed. Special combination offers might be made, in which "own-make" goods should figure.

There is a great deal in psychology. Many people go to the circus who would not coolly calculate to do so, simply because the street parade attracts a crowd and the individual yields to the impulse of the crowd—is stampeded. If the druggist will so make his arrangements for a tooth-preparations week that they will get the people coming to his store in crowds, and get the crowds so interested that they will buy on account of a quasi-hysterical impulse, then it may be said that his campaign was a success. And even if it does not reach this stage he should be able to get profit out of it; and even if he does not sell enough tooth goods to pay for his advertising, the campaign will not have been in vain as it will have a sort of cumulative effect and make other campaigns easier. It will also have made the public better acquainted with his store and cause them to regard him as an active, aggressive man worthy of their patronage.

Dregs sink to the bottom of a bottle of syrup. Admitted. Most people do not like to drink dregs. Not disputed. Draining the last teaspoonful of syrup from a bottle will bring out such dregs as there may be in it. Hardly denied. Well, what's the answer? Let each man find it for himself.

Be Good to the Drummer and Maybe He'll Be Good to You.

Three Timely Trims.

To Give Pause to the Holiday Shopper Is to Get Some of His Trade—Suggestions for Catching the Passing Eye—How to Make the Window Work.

BY BILLEE BARRIE.

Twice in the year's roll of seasons comes a time when savings banks are multitudinously visited and the stockinged hoard is scattered. Once, when the sun shines on both sides of the street and the vacation germ becomes lively; again, in the pre-holiday days when even the baby's bank suffers from the spending epidemic. And illy a druggist is he who profits not out of the universal pastime of buying.

Who gets the vacationist's money? The man whose bid for it rises high above a whispered request. Who profits from the Christmas buying? Whosoever catches the shopper in his flight. Then let the visible portion of the store be decked with that which suits the gift-giving fancy or the other exigencies of the season.

Brother druggist; try these in your window:

SAVORING OF SAVORINESS.

In the beginning of the third week before Christmas, having cleaned and polished the glass front, spread over the bottom of the window a white cloth and place thereupon three pedestals of any convenient size and shape. Upon each pedestal set a large glass bottle or carboy, one filled with water colored light yellow, another containing a solution of caramel, and the third full of a not too brightly orange liquid. Label the respective containers so as to give to the gazer the impression that they contain flavoring extracts: lemon, vanilla, orange. Seal the top of each container with a goodly amount of red wax; and attach to each a "This-is-to-certify" document bearing a saw-toothed scarlet or golden seal, and lettered in heavy near-engrossing so as to simulate a decree of the highest mighty-and-majestic. Let the lettering be a certification of the purity of the contents and a statement of the ingredients. Embower this exhibit with a trellis of green leaves, cut out of shiny coated paper. Hang among the leaves three groups of fruit: over the lemon extract, elongated spheroids of canary-colored tissue paper; over the brown liquid, bunches of long slender twists of brown tissue paper, glossed over with shellac; and over the orange extract, orange-colored globes of tissue paper. Hang the back with more leaves, and, if desired, more fruit. Let the announcement card be of white cardboard with pasted-on leaves and fruit from a soda-water advertisement; and let it tell how almost futile is the endeavor to concoct delicious comestibles without those particular flavors, and also how little money is asked for eight, or sixteen, or more, full teaspoonfuls of the flavorings.

HELPING IN GIFT-SELECTING.

After a week has passed remove the colored water and the paper vegetation; wash well and polish highly the glass front, and proceed to arrange the following: Get fifty sheets of the largest size of white paper to be found at the printery. With paste and cloth give to this pack of paper the appearance of a note book, with a turned-back cover. Rule the first page of this tablet and letter it thus:

For Father—Calabash pipe. Get it at Casserole's.
For Mother—Piece of cut glass (she wants a rose bowl). Get it at Casserole's.
For Buddy—Safety razor. Get it at Casserole's.
For Sis—Five pounds of candy. Get it at Casserole's.
For Mary—That manicure set at Casserole's she admired.
For Tom—Military hair brushes. Get them at Casserole's.
For Grandma—Big red hot-water bottle. Get it at Casserole's.

Get on as many items as the space will permit. Place this gift list on an easel in the center of the window, the bottom having been covered with a crinkled cloth of any desired color. Arrange about the window one each of the various items contained in the list, using the best grade of each and attaching to each a small holly-decorated card giving the range of prices. For the background hang a piece of white cotton-flannel, wooly side showing, on which

has been glued a scattered group of conventional cone-shaped evergreens cut from green paper and sparingly hung with globs of cotton "snow."

THE UNIVERSAL FAVORITE.

For the big-buying week a candy display is most suitable; and to arrange a catchy one cover the bottom of the window with a mirror or a plate of glass over a dark cloth—it is assumed that the glass has been duly cleaned and polished—and place at one side, in the "bend" of the window an elevated platform made of a barrel head resting on blocks about four inches high, and connected all around with the floor by means of cardboard sloping in at the top. Over the entire sloping shoulder arrange a layer of green French creams (the 20-cent sweets of our youth). Arrange on the platform a mosaic of creams of various colors simulating a bed of flowers. In the center of the window build a circular coping of green lime drops and within this erect sprays of rock-candy on thin wires to resemble a splashing fountain. Here and there have small rustic bowers of chocolate chips, bizarre pergolas of striped sticks, grottoes of chocolate drops, pagodas of brown and yellow caramels, popcorn bushes made by tipping thin wires with colored popcorn grains and bending them into shape, marshmallow palaces, "clear toy" figures, horehound rock walls, and any other additions to a landscape that fancy may dictate. If small colored electric lights can be included the effect is greatly enhanced, particularly after dark. Hang at the back a light-blue silk ground sprinkled with tinsel stars. Above the display hang a silver-paper placard with the following wording:

A GLIMPSE OF CANDY LAND
The Sweetest Place on Earth

Send your friends
Go yourself

Everybody enjoys the trip

P. S. After Christmas run a display of tooth brushes and dentifrices.

Suggestions for a Christmas Window.

Over at Allentown, Pa., Dr. Nagle's Pharmacy seems to have captured a window dresser with ideas. His Fourth of July trim was described and photographically illustrated in the CIRCULAR for August, page 442, and he has described one of his Christmas displays for the CIRCULAR.

The central feature of this trim is an airship, suspended from the ceiling of the window space, the passenger in the ship being a conventional figure of Santa Claus. The back, sides, and ceiling of the window are covered with festoons of laurels, and the floor by a light-colored cloth. One sign, held in Santa Claus' hands, referred to the old gentleman's personal endorsement of the goods distributed about the window, while another and larger one, bearing the store's expression of the season's good wishes, was placed in an appropriate corner.

The body of the airship was made of a 25-pound insect-powder keg, through holes in the center of which a wooden broom handle had been run, longitudinally. From each end of the keg to the corresponding end of the stick, fine wires were strung, and the whole was covered with paper tacked or pasted on. The car was made of board. It need not be in the form of a box at all, but may be represented by a single board, hung by one edge from the car above. The propeller may be cut from card board, and attached to the car by means of a small rod. A lattice-work for the car, made by winding colored twine around the board, gave a more finished appearance to the outfit.

Dr. Nagle's window trimmer does not claim that the idea is new. A somewhat similar trim was described by J. G. Brooks in the CIRCULAR for November, 1907, page 714. The suggestion, however, is a good one, and now is a seasonable time to act upon it.

Just about the neatest, most attractive, most helpful booklet addressed to soda-water dealers that has come this way in many a season, is the Bishop-Babcock-Becker "Bigger Broader Business"—there's a swarm of B's for you! This booklet begins by saying that the annual sales of soda water amount to approximately \$500,000,000, and asking the reader if he is getting his share; and before it ends it has given him many suggestions as to how he may get his share and maybe a little more.

Hot Soda as an Adjunct to Cold.

Increased Call for Hot Beverages in the South—An Attractive Baltimore Fountain at Which Women Shoppers May Indulge in Hot or Cold Soda and a Luncheonette..

There is every indication that the business in hot drinks at Baltimore soda fountains this fall and winter will be greater than ever before. The public is being gradually educated to ask for hot soda, and the "habit" is taking a strong hold on the people of the Monumental City. Many of the soda fountain men that have made provision to take care of the augmented demand, and the number of stands where hot drinks are dispensed will be larger than ever. Some of the druggists who have heretofore held aloof from hot-water urns and the other equipment feel that they can no longer afford to do so, a steady trade having been developed by the pioneers in the movement which promised to benefit all druggists who equipped themselves to take advantage of it.

HOT DRINKS MUST BE GOOD TO BE POPULAR.

Of course, the hot-drink business, like everything else, is not to be treated with indifference if a soda-fountain stand is to make a success of it. There must be more than a mere disposition to serve a customer who happens to call for a glass of hot soda. Real enthusiasm and that indefinable something which leaves no doubt in the mind of the patron that the proprietor regards what is being done as worth doing well must be in evidence. Mere perfunctory acquiescence in the fact that a demand for hot soda exists and that the soda-fountain man has made up his mind to serve something in that line, but that the whole business is a lot of bother and of no account, will not yield a profit. Much depends upon the personality of the man behind the counter as well as upon the quality of the drink.

According to Ralph A. Nattans, general manager of the Read Drug Company, which conducts two stores at Baltimore, the business in hot drinks is well worth looking after, and is rapidly on the increase. The Read Company's down-town store, at the southeast corner of Lexington and Howard streets, a section crowded during the day with women shoppers, but deserted at night, is a day-time store only.

Speaking of the hot-soda trade to a representative of the CIRCULAR, Mr. Nattans said:

"Although it is still early in the season, and the business in hot beverages may be said to have hardly more than begun, we already notice a big increase in it. In the first place, we have sought to make it as attractive as possible for our patrons, and with this end in view we have installed one of the handsomest fountains that money could buy. As you see, it is rigidly plain, but attractive, there being a quiet dignity and a refinement about it which people of good taste admire. This fountain, which is entirely of onyx, marble, plate glass and plated metal work, gives us about 27 feet of counter room. The only adornments are a large bowl of fruit and flowers. The latter we always keep fresh, giving a vernal touch to the entire fountain.

ALL COLD SODAS, FIVE CENTS.

"We believe in small margins of profit and in a large volume of business, hence all our drinks, both hot and cold, are 5 cents, with the single exception of large sundaes, which are 10 cents. Thus, while we occupy an expensive location and are under a big outlay for expert help, and plenty of it, we get the patronage of the great public and not merely of a limited part of it. The low price does not mean cheapness of material. We buy the best quality of everything that is put into our drinks, and we place competent, efficient men in charge of the service. Our young men wear white coats and white aprons, with the name Read's on the collars of the coats, but without any other distinguishing mark. The men are not permitted to wear caps or any other headcovering, and they are required to be polite and accommodating.

"Our list of hot drinks includes chocolate, cocoa, all the bouillons and broths, and similar things. We have one of the latest urns, of three compartments, each holding 3 to 3½ gallons. In addition to the ordinary method of heating, we installed an electrical apparatus, which enables us to heat a drink in just 45 seconds.

SHOPPER'S REFECTORY.

"As a great majority of our customers are women, girls and children, we make our fountain additionally attractive to them by serving fancy cakes with hot drinks, salt wafers with bouillon and beef tea, and liberal quantities of whipped cream with chocolate. We also sell sandwiches of various kinds. By this means we attract many persons who would not otherwise come into our place, but would get something to refresh them from the fatigues of shopping in the various department stores nearby. We have ham, tongue, chicken-salad, and lettuce-and-egg-sandwiches, and they are not of the usual afternoon-tea size, but good generous slices of bread with something between them. The sandwiches are made up fresh in batches of about thirty or forty, so that they do not get stale. We also offer pound cake and fruit cake.

ADVERTISING.

"Of course, we are not content to rely entirely on the quality of our soda fountain beverages and eatables to extend the business, but advertise in a judicious way. There is not a package going out of the store that does not have one of our printed slips, which are changed every week, each department being taken up in turn."

By way of explaining his advertising method Mr. Nattans produced a pad showing in regular order the slips for a number of weeks past, with a memorandum covering the soda fountain for the very next issue. The slips are about four by three inches, printed on good paper in bold, clear type. The merits of the soda water and other articles sold in the store are set forth in striking phrases.

"We also use the newspapers," continued Mr. Nattans, and he exhibited one of his recent cards, occupying some three inches of a single column, showing an illustration of a cup, with references to hot soda and other things printed on the side of the cup, and a cloud of steam rising therefrom. Under the picture of the cup was the catch line of the store, "Run Right to Read's," outlined in white on a black background. The card was easily the most conspicuous on the page, though not flaring.

Some lettered signs outside the store are the third method, but this has been practiced less extensively during the past month than before. There are no cards about the fountain, the proportions and natural beauty of which are relied upon to make a stronger impression upon the patron than would be produced by decorations.

All the mixing and drawing of soda water and other drinks is done right before the customer, so that she can satisfy herself that the processes employed are scrupulously clean. During the greater part of the shopping hours three dispensers are employed, and at no time less than two.

Mr. Nattans looks for a large increase in the hot soda business this winter.

Tips for the Soda Clerk.

Give the man what he thinks he wants; don't try to convince him that what you have served is it. You may be right, but he has the money.

Remember the story of the man who ran to get across the street ahead of the electric car, and then turned around and watched the car go by and disappear: he was in no hurry, but he just simply had to beat that car. The same man may sit on the stool five minutes after finishing his drink and receiving his check, but if he had to wait half a minute for the check he would be almost ready to throw a fit. Humor him; he helps to pay salaries.

Hunger is the best sauce for a meat dinner, and pleasing manners behind the counter lend an agreeable flavor to all fountain confections.

Syrup is one of the most expensive articles used at a fountain—especially now that sugar is chasing the beef that has got nearly as high as the moon—and it is one of the most wasted, the average drink dispensed being too sweet.

Once a soda clerk put his fingers on the rim of the glass in serving a customer. The judge gave him ninety days, and they all said he got off easy.

Every drink served at a fountain should be "custom" made and "custom" served, and not dished out by the dozen. Those who need a diagram for this chip of wisdom would not be helped by it.

A few paper napkins kept within easy reach about the soda counter come in handy on many occasions.

Serve each customer as if he were a new one and you wished to make him come back.

Opening Day at the Fountain.

Not too Early to Plan for an Increased Soda Business Next Year—One Man Took Time by the Forelock and Proved a Winner—Some Details of His Successful Methods.

How his new soda fountain was installed, how he let the folks know about it, and what some of the results have been are the burden of a little lay sung by a Tennessee pharmacist whose fame extends far beyond the confines of his city, or even State.

Ira B. Clark is this druggists' name, and Nashville is his place of business. Let him tell his own story, and let all pay strict attention, as it carries a lesson which should prove of value:

AN EARLY START.

"In the first place, I gave myself plenty of time for the installation of the new apparatus, by buying the latter part of last year and having it shipped in January, during the dull season, and at a time when the manufacturers are not so much rushed with orders. I think this matter of early buying is very important, as it gives the factory more time to get the fountain assembled properly, and it gives the buyer plenty of time to make the installation and allow for the length of time taken up by the plumbers, electricians, etc., as they are notoriously slow in such matters.

"Without undue delay my new fountain was installed, plumbing and electrical connections all made, and ready for business February 8th. At this time the weather man was on his good behavior, and with the favorable weather he handed out, business was good from the time the first glass was drawn and continued good until the first cold snap of fall. Of course, those of us who have had experience with a fountain know that the first part of the cold soda season is always the best.

ADVERTISING AN OPENING.

"On May 4th I gave a soda-fountain reception which was quite the most pretentious thing of the kind that was ever 'pulled off' in this 'neck of woods.' I advertised the event by distributing 3,000 circulars, 1,500 at a time, the first lot going out two weeks before the date of the reception and the others one week before, and in addition to the circulars that were distributed, I mailed 500 invitations three days before the event.

PRIZES FOR MEN AND WOMEN.

"The day of the reception broke clear and fair, and I had the store and fountain decorated with cut flowers and potted plants, and was told by a great number of my customers that the work was very tastefully and attractively done. The entire store force waited eagerly for the 'show' to begin, it having been set for two o'clock. I had a band of music from two until eleven o'clock, and promptly on the former hour the music struck up a lively air and from then until late at night the store was packed. I gave a very pretty souvenir to each lady who visited the store, and in addition I had a number of samples, including candy, face powder, talcum powder, toilet water, perfume, etc., placed in a two-pound paper bag and fastened with a clip, which was given out to each lady. I also put in the bag a two-dram vial of extract of vanilla of my own make, which has proven excellent advertising, judging from the increased sale of this product since that time. I also had a contest, the prize being a cut-glass bowl, in naming a new perfume. The perfume was a combination odor and the prize was given for the most appropriate name for it. This feature proved quite the best number on the program, as the counter devoted to it was crowded all during the afternoon and evening. A great number of good names were suggested, and the one which I selected as the most suitable was 'areo mist.' In this connection, I will say, no purchase was required in order to enter the contest. I also had a prize of a box of cigars for the men.

GETTING ACQUAINTED.

"At two o'clock I stationed myself at the front door, with the idea of meeting personally every one who entered, and if possible giving him or her a word of welcome and a hand shake. This I succeeded in doing fairly well, but, of course, was called away occasionally to wait on some particular customer. With the exception of thirty minutes of time for a little luncheon, I was "on the job" from two until eleven o'clock, and it seems hardly necessary for me

to state here that I felt, when bed time came, that I had done a full day's work.

"Quite a bit of my general trade is by 'phone, and I have some customers that rarely come into the store. On this occasion a number of ladies introduced themselves, who, I recalled, were good customers of the store, but did all their shopping by 'phone.

"The reception was a decided success, as before stated; it brought a number of people into the store who possibly had never been in before, and thereby established a closer relationship and a more friendly feeling between them and myself.

KEEPING IT UP.

"The 'opening' is still mentioned frequently by my customers. In order that they should not be allowed to forget the new fountain, I had several thousand post cards made bearing its picture in colors, and during the summer months I mailed these, using my mailing list of 500 names, once a month, calling attention to the quality of my ice cream and cold drinks, and to special drinks occasionally, as they were put on. I played service and quality up strong on these cards and have been very particular to see to it that these two features were maintained at the fountain.

"The season has been an extremely favorable one so far as the weather is concerned, and to this, combined with the new fountain and the advertising thereof, I attribute the doubling of my soda trade this year. The increased trade at the fountain has helped the general trade to a very gratifying degree.

NO CHILD'S PLAY.

"I want to say right here, that putting on an affair of this kind is not child's play, and any one contemplating such a thing may expect to do a lot of hard work to make it a success. But the returns are good, and from an advertising standpoint the outlay is very profitable, and my advice to anyone and everyone installing a new fountain is to let his trade know of it with an 'opening,' but do not stop there; make it an annual affair, as I expect to do, with, of course, some modifications. It will pay and pay in big returns."

Whipped Cream.

Whipped cream added to a suitable drink is a comparatively inexpensive addition, which adds greatly to its attractiveness and, being appreciated by the customer, the dispenser can well afford to devote the time involved in making and serving it. Special machines have been constructed for whipping the cream, but most dispensers prepare it with an ordinary egg-beater. Genuine whipped cream is nothing other than pure cream into which air has been forced by the action of the different apparatus manufactured for the purpose; care must, however, be exercised in order that butter is not produced instead of whipped cream. To avoid this, the temperature of the cream must be kept at a low degree, and the whipping must not be too violent or prolonged; hence the following rules must be observed in order to produce the desired result:

1. Secure pure cream and as fresh as possible.
2. Surround the bowl in which the cream is being whipped with cracked ice, and perform the operation in a cool place.
3. As rapidly as the whipped cream rises, skim it off and place it in another bowl, likewise surrounded with ice.
4. Do not whip the cream either too long or too violently.
5. The downward motion of the beater should be more forcible than the upward, as the first has a tendency to force the air into the cream, while the second tends, on the contrary, to expel it.
6. A little powdered sugar should be added to the cream after it is whipped, in order to sweeten it.
7. Make the whipped cream in small quantities, and keep it on ice.—*Southern Pharmaceutical Journal.*

We are pulling down the boss's cash every day for serving his customers in a polite, courteous, cordial manner, and public demand for such clerks has had much to do with the making over of a lot of the old grouches who occasionally have broken loose in our midst.—*Iron Age Hardware.*

Some druggists think a formula is the key to success as a manufacturer; others buy an ointment mill.

Shortcomings of Salespeople.

A Strollerette Comes to Judgment—Breathing on Scale Pans, Mixing Perspiration with Candy and Some Other Things Animadverted Upon by a Real Lady.

In the November issue of the CIRCULAR a certain "Stroller" told the story of his life and brought much dark material to light. Now it so happens that I am one of those "real ladies" of whom he made mention, and I know several very dark things indeed about which the "Stroller" has no knowledge, even though he has been in drug stores without number.

CANDY THE SUBJECT OF HER QUEST.

Unlike the above mentioned "modern Harun-al-Raschid," I do not especially care for soda water, but there is another side line carried by practically all druggists which is frequently the recipient of my patronage—in other words, I have what is known as "a sweet tooth," and candy is always a temptation. 'Twas this craving for sweets that led me to the candy counter in a drug store which I had always found spotlessly clean.

It was quite early in the morning, and my stomach was doubtless shouting "castor oil," but I mistook the voice and so thought the demand came from my "sweet tooth." Alas, mistakes are costly, and in this instance the price paid was quite high. As I entered the store I noticed the attendant polishing the scales, and in his hands he held the pan or scoop, which, to my inexperienced eyes, seemed dazzlingly bright.

Before making my wants known I smiled as sweetly as only a real lady can, and said: "Do you polish your scales every day?"

The answer was, "Yep. That's goin' some, ain't it?" And then, oh, horror of horrors, he breathed on the scales and rubbed as though all the elbow grease in the world was centered at a spot near his "funny bone." Needless to say, the smile of the real lady came off, and her craving for candy was not satisfied that day.

HER APPETITE ON AGAIN, OFF AGAIN.

It was quite a long time before I again ventured into a drug store for candy, but one very warm day last summer I dropped into a convenient pharmaceutical restaurant for a sundae. Before securing my check I chanced to glance over the counter and saw how the glasses were washed, or, to put it more correctly, how they were smeared. The soda dispenser merely dumped them into water which had, apparently, served as a bath for all the soiled glasses of the day. His hand went into the water with each immersion of a glass, then still dripping wet, the same hand was held over the glass in which he prepared the next beverage called for.

Disgusted, I turned to the candy counter, where a neat looking chap was weighing out something for a customer. It was a country drug store and the demand for chocolates in original wrappers was not large there, and practically all the confectionery sold was weighed out by the young clerk. He was quick and graceful, and I enjoyed watching him. I soon had the opportunity to make my wants known, but I wished with all my heart that I had never opened my lips to him on the subject, for in order to facilitate the operation of wrapping up my purchase he moistened his fingers in his mouth before seizing upon a piece of paper which lay ready to his hand. That is a store to which I shall never attempt to "come back."

A WOMAN JUDGES WOMAN.

My next experience was also in a village and on a warm day. The drug store was quite large and there were two girls on its force of clerks. The place was practically empty at the time. Miss Toilet Articles was talking to Miss Confectionery when I entered. After I had waited long enough to realize that "he sez," and "I sez" really do sound better than the old-fashioned "sez 'e,' sez I," Miss Confectionery, with eyebrows raised as if to say that she didn't at all approve of my appearance, finally condescended to notice my presence. Meekly I made my wants known, then perched upon a stool to wait, for a still, small voice which has often proved my friend, told me that it would be just as well to make myself comfortable. When my patience was about exhausted I peeped to see what could be the cause of the long delay. I did not find out, but I saw the cover of a newly opened candy box firmly

held under the perspiring arm of the lady in waiting, and, worst luck of all, the inside of the cover was pressed close to the steaming body, which was partly covered by a peek-a-boo of peek-a-boos. I wondered who would get the top layer from that box of candy after the cover had been replaced, and again removed. As for me, I was more than glad that my candy came from a box whose lid I had not seen in any such intimate contact with a none-too-appetizing body.

Of course at the larger drug stores people generally buy their candy in original packages, but when I can I like to have mine weighed out before my eyes. No, I'm not afraid of being cheated; it just happens to be one of my little peculiarities, but the experiences I have had have almost cured me. One can't really be blamed for not relishing an addition to her chocolates of saliva, perspiration, etc., let alone the horrid germs.

A NEWPORT WINDOW DISPLAY.

And now while I have my hammer in action, I might as well relieve my mind of something else concerning a drug store which has been agitating it for some months. Newport, as everyone knows, is a very beautiful city, and most of its drug stores are kept in a commendable manner. While visiting that city last summer, however, I learned to understand just how much window displays counted for. This is how I received my lesson:

Several times while walking along the principal business street I had observed a drug-store window, which, thank goodness, was unique. In addition to being unique it was an eye-sore, and I thought, in my womanly way, "I wouldn't be hired to buy anything in such a looking place."

One day, when walking with my cousin, I chanced to gaze at the window in a manner to attract her attention. "Maybe you will not believe it," said she, "but that's the neatest, nicest drug store in the city, and I always like to trade there."

Surprised, I looked into the store as we passed the door, and certainly nothing could have been more attractive than its orderly appearance and conveniently arranged stock. The interior of the store seemed to say, "Come and buy," but the window said in even louder tones, "Here's where you buy the things Noah and his family could not use. Going cheap!"

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer,
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

	3 months.	6 months.	12 months.
One Page.....	\$248	\$438	\$750
One-Half Page.....	142	238	438
One-Third Page.....	115	166	300
One-Quarter Page.....	86	125	225
One-Sixth Page.....	60	100	166
One-Eighth Page.....	45	70	125
One-Twelfth Page.....	34	56	100
One-Sixteenth Page.....	25	43	75
One-Twenty-fourth Page...	19	33	56
Card 2½x¾ inches.....	11	19	33

Special prices are charged for preferred positions. Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

NO ORDER GIVEN TO ANY REPRESENTATIVE OF THIS PAPER BECOMES BINDING UNTIL APPROVED BY ITS MANAGER.

QUESTIONABLE OR UNDESIRABLE ADVERTISEMENTS WILL NOT BE ACCEPTED.
